Egypt

Oilseeds and Products Annual

Egypt To Remain An Attractive Market for Soybeans and Products

Approved By:
Ron Verdonk

Prepared By:
Ahmed Wally

Report Highlights:
Egyptian oilseed production is constrained by limited planted area, forcing Egypt to rely on imports of oilseeds and derivative products. Soybean imports are expected to rise slightly to 1.87 MMT, reflecting additional crush capacity and meal demand. The poultry and aquaculture sectors are expected to grow modestly, resulting in soybean meal imports rising to 1.0 MMT in 2014/15. Meanwhile, the oil market continues to be dominated by government-subsidized soft oils (soy/sun blend), although palm oil imports are expected to continue to grow.

Commodities:

Oilseeds

PRODUCTION

Soybeans: Post forecasts soybean area and production in MY 2014/15 to remain constant compared to the previous year, at 8,000 HA and 20,000 MT respectively. While currently stable, the area and production is half what it was five years ago. The most important variables that led to the decline in cultivated area are production costs, farm gate price and the net revenue of the crop compared to more profitable grains such as corn and rice.

The Agriculture Research Center (ARC) of the Ministry of Agriculture and Land Reclamation (MALR) is the authority responsible for the production and marketing of soybean certified seeds. Soybean varieties Giza 21 and Giza 83 are cultivated in the Delta, varieties Giza 22 and Giza 35 are cultivated in Middle and Upper Egypt, while the variety Giza 111 is very successful in the newly reclaimed areas in the New Valley Governorate in Upper Egypt. Research with a goal of improving yields continues, and productivity today averages 2.5 MT/HA.

Sunflower Seeds: Post forecasts an increase in sunflower seed total planted area and production in MY 14/15 to reach 7,000 HA, up by 1,000 HA over the current marketing year's level. Production is expected to rise to 17,000 MT, up 1,000 MT from the most recent production cycle as a result of improved agricultural practices. Area and production have been revised for 2012/13 and 2013/14 to reflect the latest Ministry of Agriculture statistics. The two main sunflower seed varieties currently planted are Sakha 53 and Giza 102 with an average yield of 2.4 MT/HA.

CONSUMPTION

Soybeans: The vast majority of soybeans are crushed with total throughput at 1.85 MMT in MY 14/15, up 30,000 MT from MY 13/14. Crush capacity is 8,000 MT/day, although facilities operate at only 60-70% capacity. Recently, the establishment of new modern crushing plants has expanded oilseed processing capacity. Firms see the opportunity to process soybeans in Egypt, where energy and labor costs are low but demand for meal and oil is rising. Operations are dominated by two large companies, which account for more than 80% of the crush. Eleven other medium-sized firms account for the remainder.

Egypt's food use domestic consumption of soybeans will stand at 17,000 MT in MY 2014/15. The food processing industry uses soybeans and soy-based ingredients to enhance nutritional quality. Flours from full fat and defatted soybeans have been used in research trials as supplements to Egyptian bread and two popular legume foods (lentil soup and falafel).

Sunflower Seed: The majority of sunflower seed is crushed, estimated at 66,000 MT for MY 14/15, nearly the same as the revised MY 13/14 crush. Imported sunflower seed is largely processed by the public sector to extract sunflower oil used in the subsidy system. In contrast, domestic sunflower seeds are crushed by small local businesses close to the production areas in Middle and Upper Egypt.

Approximately 7,000 MT of sunflower seeds are directly consumed by Egyptians in the snack food sector. The confectionary sunflower seeds are sold to consumers roasted and seasoned on an in-shell basis.

TRADE

Soybeans: Post forecasts soybean imports in MY 2014/15 to reach 1.87 MMT, up 70,000 MT compared to MY 2013/14. We attribute the increase to an anticipated growth in crushing and refining capacity for soybeans, awareness by consumers of the nutritional value of soybeans and soybean oil, growth in feed demand, and expectations of an improved economic environment.

In MY 2013/14, the U.S. market share in the soybean import market is expected to come in at 40 percent. Other suppliers include Argentina, Uruguay, and Ukraine. The current average price for imported soybeans is about $580/MT C&F, Alexandria. The current price of local soybeans is about $492/MT.

Sunflower Seeds: Imports of sunflower oilseeds in MY 2014/15 are forecast to reach 60,000 MT, equal to the revised amount for MY 2013/14. Black Sea countries are the primary suppliers.

<u>Meal</u>

PRODUCTION

Egypt's feed manufacturing mills produce poultry feed mix consisting of 70 percent yellow corn, 19.4 percent soybean meal, 3.4 percent wheat bran, and 1.9 percent broiler concentrates (fish or meat meals) in addition to different additives including minerals and vitamins. Soybean meal constitutes a large proportion of feed ingredients used in aquaculture and animal feeds. The main protein sources used for fish feed production in Egypt are soybean meal (included at 20–40%) and fish meal (3–22%). Egyptian production levels of major feed ingredients currently used for animal feed and aquaculture feed production do not meet local demand.

Soybean Meal: Posts forecasts soybean meal production at 1.47 MMT in MY 2014/15 with a slight increase of 20,000 MT over MY 2013/14. Locally owned crushers are currently meeting close to 60% of Egypt's soybean meal requirements, but, given unused capacity, should be able to cover a larger percentage of local demand. Soybeans crushers are 90% privately owned and 10 % publicly owned.

Sunflower Meal: Post forecasts sunflower seed meal production in MY 2014/15 at 37,000 MT, similar to MY 2013/14. The sunflower seed extraction rate is 56%, reflecting the inclusion of the seed's shell in the meal. This result in a high fiber meal, which must be blended, mixed with the more easily digestible soybean meal.

CONSUMPTION

Soybean Meal: Post forecasts soybean meal consumption at 2.46 MMT in MY 2014/15, an increase of 60,000 MT from MY 2013/14. Soybean meal is the major protein source, comprising about 25-30% of the feed content used in animal, poultry and fish feed consumed in Egypt. Approximately 1.2 MMT of soybean meal is consumed by poultry, 550,000 MT by feeder and dairy cattle and about 550,000 MT by the aquaculture sector. Feed consumption is forecast to grow by 3-4% due to expected growth in the poultry and aquaculture sectors. Aquaculture is heavily concentrated in tilapia fish production and becoming more innovative in terms of using high quality feed rations based on protein meals, primarily soybean meal. Industry sources also indicate that there will be new public-private investments and private investments in the both the dairy and poultry sectors in the coming years.

Egypt's soybean meal consumption is affected by the status of livestock, poultry, and aquaculture sectors. Outbreaks of diseases like avian influenza and FMD significantly affect feed consumption, similar to what happened in MY 2011/12 and MY 2012/13.

Sunflower Meal: Total sunflower meal consumption is likely to reach 157,000 MT in MY 2014/15 increasing by 15% above the current marketing year. This is due to the use of sunflower meals in various feed mixes by the aquaculture sector.

TRADE

Egypt's total production of oilseed crops has been declining, which has resulted in lower self-sufficiency rates in oilseeds. Furthermore, when taking into account the rising volume of oilseed imports, domestic crush capacity, even if operating at nearly full volume, would not be at the level needed to meet domestic demand for oil and meal. As a result, edible vegetable oil imports have continued to climb. The potential for reducing the gap in vegetable oil under the prevailing production and consumption pattern is unlikely to occur in the near future especially with a population growth of 2 percent annually that drives higher demand for food. Egypt relies on imports to meet the demand for food and feed and their related industries.

Soybean Meal: Imports of soybean meal in MY 2014/15 are expected to reach 1MMT, which represents 40% of the total expected meal supply. Imports should grow by 50,000 MT from the current marketing year's estimated volume, due to increasing demand for high feed quality based on best feed and feeding management practices. Poultry and aquaculture industry participants recognize the role that quality plays in supporting the overall performance and growth of the sector. According to the Central Bank of Egypt, greater stability is expected in the coming year in the value of the Egyptian Pound (LE), which would support higher imports.

The major suppliers of soybean meal to Egypt in MY 2013/14 have included Argentina, Paraguay, United States, Ukraine and India.

Sunflower Meal: Imports of sunflower meal in MY 2014/15 are forecast to reach 120,000 MT, 20,000 MT higher than the previous marketing year due to the demand by the aquaculture sector to use sunflower meal in different feed mixes. Ukraine is the major supplier of sunflower meal to Egypt.

Oil

PRODUCTION

Soybean Seed Oil: Post forecasts soybean oil production in MY 2014/15 to come in around 330,000 MT, an increase of 5,000 MT over MY 2013/14. The increase reflects higher crush due to a larger volume of imported soybeans.

Sunflower Seed Oil: Post forecasts sunflower seed oil production to total about 28,000 MT in MY 2014/15, up 1,000 MT compared to the current marketing year.

CONSUMPTION

Post forecasts the total quantity consumed of edible (vegetable) oil in MY 2014/15 will be 2.57 MMT, slightly higher than the current year at 2.48 MMT. Of this total, palm oil represents about 38%, sunflower oil 34% and soybean oil 28% of the quantity consumed.

A major feature of the oils market in Egypt is the subsidy system, representing around 80% of total soft oil consumption. As a whole, food subsidies in the 2014/15 fiscal budget account for LE 34 billion/$4.8 billion with a 10 percent increase over the previous budget of 2013/14. Subsidized bread is the largest portion of the program (LE 24 billion/$3.4 billion), while oils, sugar and rice account for a must smaller amount (LE 10 billion/$ 1.35 billion) of which oils is subsidized by (LE 4.4 billion/$ 600 million). A gradual removal of the subsidy program will increase the private sector market share, enhance quality, and will contribute to significant growth to the industry.

Subsidized oil is a 50/50 blend of sunflower and soy oils. It is distributed via a ration card program, which now covers 68 million people. Ration card holders are allowed 0.5 kg/person/month at a subsidized price of LE 3/kg ($1 = LE 7.40). An additional 1.0 kg at LE 3/kg (with a maximum of 4 kg per family per month) is allowed. For example a family of 6 persons under the current subsidy system receives 3Kg of oil (0.5Kg x 6) and an additional 4 Kg of oil with the price of 21LE per month. The average price for oil produced by private industry in the domestic market ranges from 10 to 17 LE/Kg.

Beginning July 2014, the Ministry of Supply and Internal Trade will test a new format for the subsidy system. The current program subsidizes bread, sugar, oil and rice. The new expanded subsidy system will allow consumers with ration cards the option to select from more than 30 food products, depending on their preferences. For example, oils will be available in 3 different grades, with prices varying according to the oil's quality. Post does not expect that this will have an immediate impact on the level of the oil consumption, though it will affect the varieties consumed. Some speculate that the new system is likely a preliminary step to the gradual removal of subsidy on products such as oils.

Edible oils in Egypt are consumed in three different formats: 1) liquid, hydrogenated; 2) artificial ghee; and/or 3) solid at room temperature. In general, blended oils are preferred by consumers. Government-subsidized oil is a blend of 50% soy and 50% sunflower oil. In the private sector, other blends such as 70% soy oil and 30% sunflower oil or 70% sunflower oil and 30% soy oil are commonly used, depending on price ratios. The most preferred consumer blended oil is sunflower oil at 50%, soy oil at 45% and palm-based olein at 5% due to its thermal stability in frying.

Soybean Oil: Post forecasts soybean oil consumption in MY 2014/15 to reach 732,000 MT, up 50,000 MT from the current marketing year.

Sunflower Oil: Post forecasts sunflower oil consumption in MY 2014/15 to climb to 890,000 MT up 50,000 MT from MY 2013/14.

Palm Oil: Post estimates palm oil consumption in MY 2014/15 at 950,000 MT, up 30,000 MT compared to the current marketing year. Because of its relatively low price and availability of supply, palm oil continues to maintain its competitive position vis-à-vis other imported oils for both human consumption and industrial use. Industry sources noted 7% growth in palm oil imports during the first quarter of 2014 due to growth in the olein, shortening and margarine market for processed foods and bakeries. In contrast to soybean and sunflower oil, all of the palm oil based business is handled by the private sector.

Post estimates more than 85% percent of palm oil consumed is utilized in human food consumption. Shortening and margarine comprise about 35 percent. Shortening is used for frying, especially in hotels and fast food chains, while margarine is used by private bakeries and patisseries. Double fractionated and RBD olein comprise 50% or more of the palm oil used for human food consumption. Though typically blended at 5%, there is the potential for blending at 30-40%. Industry sources indicated that illegal blending with ration card system edible oils has stopped.

TRADE

The majority of soybean and sunflower oils are imported for the domestic food assistance/subsidized programs. They are purchased via monthly tenders by the Egyptian Holding Company for Food Industries (EHCFI) and MEDI Trade Company (MTC) for delivery to Egypt's Ministry of Supply and Internal Trade's (MOSIT) General Administration for Supply Commodities (GASC). Typically, crude oil is purchased from private industry and traders and is then refined through affiliated state-owned companies (EHCFI has 6 affiliated companies) or private companies.

Ministry of Supply/GASC Oil Tenders MY13/14

Date of Tender	Oil Type	MEDI Trade Company (MTC)	Egyptian Holding company for food Industries (EHCFI)
Oct. 2013	Soybean Sunflower	20000 MT 18000 MT	23500 MT 12000 MT
Nov. 2013	Soybean Sunflower	55000 MT 24000 MT	25000 MT ------------
Dec. 2013	Soybean Sunflower	25000 MT -----------	------------ 44000 MT
Jan. 2014	Soybean Sunflower	5000 MT 22000 MT	----------- -----------
Feb.2014	Soybean Sunflower	------------ ------------	55000 MT 54000 MT
March.2014	Soybean Sunflower	15000 MT 37000 MT	----------- -----------
May. 2014	Soybean Sunflower	------------ 56000 MT	15000 MT ------------

Although Egypt will remain a net oil importer, industry sources indicate that due to its strategic position, the country is a hub for refining, packaging and re-exporting imported palm oil in the region. This could also happen with sunflower and soybean oil imports to a greater extent if a gradual removal of subsidy on oil takes place, widening the market for Egypt refined oils.

Soybean Oil Imports: Soybean oil imports in MY 2014/15 are forecast to reach 420,000 MT. This is a slight increase from the current marketing year's volume of 400,000 MT, which is revised up from USDA official estimates, based on available trade data. The 5 percent increase in imports is attributed to an increase in soy oil consumption that is blended with sunflower oil for the subsidized market.

Industry sources indicate that the situation in Libya, Syria and to some extent Yemen caused a decline in re-exports in MY 2013/14 by almost 50% compared to previous marketing year. For MY 2014/15, soybean oil re-exports will likely rebound slightly due to blending palm-based olein with sunflower and soybean oil and re-exporting it to other markets in Africa.

Sunflower Oil: Sunflower oil imports in MY 2014/15 are forecast at 850,000 MT, up 100,000 MT compared to the previous MY 2013/14. We attribute the increase to consumer preference for sunflower oil in many cases and an expected 6 percent increase in sunflower oil consumption for the subsidized market. Post estimates MY 2013/14 at 750,000 MT, revised down from USDA official estimates based on available trade data. Higher exchange rates in certain periods during MY 2013/14 caused lower sunflower oil imports, as the private sector opted for more affordable palm oil.

Palm Oil: Imports of palm oil in MY 2014/15 are projected at 1.1 MMT, up 60,000 MT more than MY 2013/14. We attribute the increase in palm oil imports to its availability at lower cost compared to other imported edible oils and the wide range of palm-based products being produced for human consumption and industrial use. The June 2014 average palm oil import price is $790/MT; sunflower oil's average import price hovered around $1000/MT while soybean oil is at an average

price of $ 890/MT.
The growth in the palm-based oil market has driven the key industry players to re-export palm oil based products to African nations with estimated exports in MY 2013/14 at 120,000MT, 60 percent of which is exported to the Horn of Africa. Post forecast a 25% increase in exports of palm oil based products in MY 2014/15 due to adequate and efficient refining capacity, enhanced logistics and available demand.

Tariffs

At present there is no tariff rate for soybeans, sunflower seed, linseed, palm kernel, and sesame seed. Oilseed meal and cake extracted from oilseeds are subject to an import duty of 5 percent. Import tariffs on bulk crude and refined soybean, sunflower oil are currently 2 percent. Crude cottonseed and palm oil duties are zero.
