

Required Report: Required - Public Distribution

Date: July 06, 2026

Report Number: BR2026-0029

Report Name: Oilseeds and Products Update

Country: Brazil

Post: Brasilia

Report Category: Oilseeds and Products

Prepared By: Samuel Dantas dos Santos

Approved By: Frederick Giles

Report Highlights:

Post maintains its initial MY 2026/27 soybean planted area forecast, with Brazil expected to achieve another record level of soybean production. Although year-over-year area expansion is projected to moderate, the increase in planted area remains the primary driver of record production, as yields may be constrained by higher production costs, elevated interest rates, and El Niño-related weather concerns. Soybean exports are also forecast to reach another record, supported by strong global demand, while domestic crushing is expected to continue expanding.

BRAZIL'S SOYBEAN AREA, PRODUCTION AND YIELD FORECAST (MY 2026/27)

Area

Post maintains the initial soybean planted area forecast for MY 2026/27 at 50.5 million hectares (HA). This represents a three percent increase from the revised estimate for MY 2025/26, currently at 49 million HA.

This growth rate is lower than the average annual expansion over the past five years, estimated at 4.2 percent. This new expansion rate suggests a slowdown in the growth of the Brazilian soybean sector over upcoming seasons, primarily due to economic uncertainty and potential climate conditions that are already impacting other crops throughout the country and require producers to adjust their planting decisions.

Most of the projected area expansion in MY 2026/27 is expected to occur in the MATOPIBA region, which largely encompasses the Cerrado biome across the states of Maranhão, Tocantins, Piauí, and Bahia. The region has several attributes that support soybean area growth, including the availability of suitable land, comparatively less restrictive environmental regulations, favorable regional demographics, and strategic infrastructure development potential, especially for commodity transportation via roads and waterways.

With the suspension of the Soy Moratorium in early 2026, an area expansion in the northern region of Mato Grosso and other parts of the state of Para and Maranhão is also anticipated, as Brazilian farmers may now gain greater autonomy to expand soybean production by accessing new land in frontier areas of the Amazon biome. However, any expansion would remain subject to other regulations, including environmental requirements under Brazil's Forest Code and deforestation-free import regulations imposed by buyers such as the European Union (EU).

Production

Post maintains the production forecast for MY 2026/27 at 184 million metric tons (MMT), setting a record for soybean production in Brazil for the third consecutive year. This volume represents an increase of nearly 2.2 percent from the recently revised MY 2025/26 estimate of 180 MMT. While the increase in production is partly driven by the projected area expansion, it can also be attributed to improved cultivation practices and better resource management, as well as investments in technology and machinery made in prior seasons.

Despite a widely anticipated El Nino season in Brazil, leading to weather instability and a potential impact on future crops, Post assumes regular weather conditions for its production forecast.

Yield

The national average productivity in Brazil is forecasted to have a small decline this season, currently projected at 3.64 MT/HA. Potential risks, related to the anticipated El Nino phenomenon, are leading some producers to reduce spending on certain inputs, especially fertilizers, which can have a direct impact on yields.

Post contacts have indicated that planting operations will potentially be delayed in some regions and perhaps harvest activities could also be impacted by weather conditions, all potentially having an impact in crop developments and overall yields that will vary by region and help balance the national average productivity.

Despite the widely anticipated impacts in weather conditions and potential changes to the soybean crop calendar, contacts' main concerns relate to the management of second crops, mostly cotton and corn.

BRAZIL'S SOYBEAN AREA, PRODUCTION AND YIELD ESTIMATES (MY 2025/26)

Area

With MY 2025/26 harvest activities nearly completed, reaching over 99 percent in June, Post revises its original harvested area estimate to 49 million HA, up 3.4 percent from the prior season. The revision aligns Post estimates with major crop reporting entities in Brazil and reflects the area reduction and crop losses in many regions of the country, such as Rio Grande do Sul, due to weather conditions and economic factors.

The revised estimates still account for a significant area expansion from the prior year. According to CONAB, MATOPIBA is the region that experienced the most increase in soybean harvested area, with an expansion of over 325 thousand HA, corresponding to a five percent increase from the previous marketing year. Other states, such as the state of Parana, Goiás, Mato Grosso do Sul and Mato Grosso also experienced significant area expansion.

Production

The increase in area is the main driver behind another record-breaking production year, with current estimates revised at 180 MMT. This revision is primarily attributed to improved weather conditions and higher projected productivity in the states of Bahia, Piauí, Mato Grosso do Sul, Minas Gerais, and other emerging producing states. Reported harvest losses were mainly concentrated in the state of Rio Grande do Sul, a state severely impacted by weather conditions for the past four seasons.

Yield

Post estimates that this new revised level of soybean production in Brazil will result in a national average yield of 3.66 MT/HA for MY 2025/26. Despite weather instability reported in different stages of the sowing and harvest season in major producing regions, which delayed some operational activities, the overall level of rain in the main producing regions contributed to favorable crop development, leading to the revised estimate level of yield.

It is anticipated that the northeast region of Brazil was the most productive region of the country during MY 2025/26, with an average yield for the region of 3.96 MT/HA. The level of yield for the region can be mainly attributed to the state of Bahia's performance, as the state reached a yield of 4.25 MT/HA, the highest nationwide and one of the highest ever reported in Brazil.

Bahia is within the MATOPIBA region, where producers have benefited from favorable land prices and lower production costs, enabling more flexibility to invest in their crops and achieve this level of productivity. Recently, producers in the region also benefited from better weather conditions, with higher levels of rain that favored crop developments.

STATE LEVEL HARVEST HIGHLIGHTS

Mato Grosso

Harvest activities completed in April. Final yields were strong, but below the productivity levels achieved in the 2024/25 season. The small decline in yield is mainly attributed to unstable weather conditions during the planting season and less flexibility in inputs management due to higher production costs.

Minas Gerais

Harvesting was completed during the first half of May with strong yields, similar to the prior season, reported throughout the state.

Goiás

Harvest concluded at the end of April, the level of rainfall during the months of March and April allowed harvest activities to progress well, while also benefiting the development of late-cycle crops. Lighter grain weights were reported by many producers, mainly due to prolonged cloudy conditions during the reproductive stage

Mato Grosso do Sul

Harvest was completed at the end of April, with drier weather and reduced rainfall supporting field operations. Most of the harvest occurred between late February and mid-March under favorable dry conditions. Overall, the season ended with more favorable yields than the previous crop year, despite some localized productivity losses due to adverse weather conditions.

Maranhão

For the main producing regions, harvesting concluded during the first half of June, while activities continue in the western and central regions, where planting occurs later due to a different rainfall calendar.

Average yields are estimated at 3.54 MT/HA, similar to last season. Despite weather challenges, including insufficient rainfall during planting, dry spells during crop development, and excessive precipitation during harvest, many production areas achieved favorable crop conditions and satisfactory yields.

Tocantins

Harvest concluded during the first week of May with strong yields reported for the entire first-crop producing region of the state. The harvest season officially began in January, with an opening harvest ceremony sponsored by the Brazilian Association of Soybean Growers (Aprosoja), held at Alto da Serra Farm in Porto Nacional, in the state of Tocantins.

Currently, Tocantins has nearly 1.7 million HA of soybean planted area, with an additional 3 million HA estimated to be suitable for grain expansion. According to the Agricultural Federation of the State of Tocantins (FAET) data, this could potentially place Tocantins among Brazil's top five soybean-producing states in the future.

Piauí

Harvest was completed during the first week of May. Average productivity is estimated at 3.96 MT/HA, representing a 15 percent increase over the previous season. The improvement reflects favorable weather conditions through most of the crop cycle as well as strong producer investments.

Bahia

Harvest activities concluded in May. The state benefited from good weather conditions throughout the season, leading to a new state productivity record at 4.25 MT/HA.

Rio Grande do Sul

Harvesting concluded throughout the state at the end of May. Overall, results were better than the previous marketing year, but still below the expectations set by producers at the beginning of season. The main challenge was the uneven distribution of rainfall during critical crop stages, particularly flowering and grain filling, which limited yield potential.

Productivity varied considerably between regions, largely driven by differences in rainfall patterns, planting dates, and the level of technology and crop management adopted by farmers.

Harvest progress was generally smooth, with only minor interruptions caused by occasional rainfall. Although yields improved compared to last year's disappointing crop, soybean prices remain under pressure, reducing profitability amid elevated production costs. Soybean continues to be a major soybean producing state, but with an uncertain future due to economic factors and the El Nino weather conditions anticipated for the next season.

Paraná

The harvest season concluded in April, with favorable weather throughout the growing cycle contributing to strong yield performance across the state.

Pará

Harvest concluded at the end of May, with late crop fields experiencing above-average rainfall, creating challenges such as weather-damaged grain and harvest delays caused by saturated soils. Despite the weather constraints at the end of the harvest season, soybean yields are estimated to be higher than last season at 3.79 MT/HA.

Updated Soybean Sanitary Void Calendar for Plant Disease Control

In June, Brazil entered the “Vazio Sanitário” period, a mandatory phytosanitary measure aimed at controlling Asian soybean rust, a fungal disease caused by *Phakopsora pachyrhizi*. During a continuous period of at least 90 days, farmers are prohibited from planting or maintaining any living soybean plants, within designated areas.

By eliminating the host crop during the off-season, the measure reduces the survival of the fungus, delays disease outbreaks in the following crop, lowers fungicide use, and helps slow the development of fungicide resistance. The specific sanitary fallow and planting calendar dates vary by state and are established annually by Brazil's Ministry of Agriculture and Livestock (MAPA).

The incidence of Asian soybean rust has increased significantly in southern Brazil during the 2025/26 season, with Paraná reporting 88 cases, more than double the number recorded at the same time last year. According to Embrapa, the rise is mainly due to wetter winter conditions that allowed residual soybean plants to survive, providing a host for the fungus, as well as early planting dates and strong disease monitoring in the state. The increase does not indicate a loss of disease control but highlights the need for timely fungicide applications, particularly multi-site fungicides, and strict management practices to limit the spread of the disease and delay fungicide resistance.

BRAZIL’S ECONOMIC OUTLOOK

Brazil's economic outlook for the 2026/27 season still suggests a combination of supportive policies and ongoing financial challenges for soybean producers. The Plano Safra rural credit program is well anticipated by producers and expected to continue offering subsidized financing, helping to support planting decisions and ease some cost pressures.

However, elevated interest rates will likely keep borrowing costs high for key production inputs such as seed, fertilizer, and machinery. Exchange rate movements also remain an important factor, as fluctuations could reduce export returns in local currency, putting additional pressure on farm profitability despite solid global demand.

To help address the financial challenges faced by agricultural producers, Brazilian federal legislators introduced PL 5122/2023, a bill that would allow farmers to restructure or refinance agricultural debt and preserve access to rural credit following severe climate events such as droughts and floods. The bill was approved by the Federal Senate on June 10, 2026, with amendments, and has been returned to the Chamber of Deputies for consideration of the Senate's changes before it can proceed toward enactment. It has not yet become law.

The proposal establishes a special rural credit program financed by Brazil's Pre-Salt Social Fund, which is supported by revenues from the country's offshore pre-salt oil production, with the aim of providing financial relief to producers affected by climate-related losses.

Key provisions of the bill include:

- Authorizing the use of Fundo Social resources to finance a special credit program for rural producers with debt related to climate impacts.
- Allowing eligible farmers to refinance or repay existing rural loans under more favorable terms, including longer repayment periods and lower financing costs.
- Covering stressed rural credit operations, including delinquent loans and certain investment loans, with the goal of restoring producers' financial capacity and preserving agricultural production.

The proposal was driven by the increasing financial strain on Brazilian agriculture following consecutive years of droughts, floods, and other extreme weather events, particularly in southern Brazil. Supporters argue that the measure will help prevent widespread producer defaults, stabilize rural credit markets, and sustain agricultural output. Critics, however, have raised concerns about the potential fiscal cost of the program and the use of oil revenues to finance debt relief.

Despite the uncertain future of this bill, the broader macroeconomic environment will continue to influence production, marketing, and export decisions. According to the Brazilian Central Bank (BCB), GDP is projected to grow by 1.82 percent in 2026 and 1.80 percent in 2027, while the Central Bank's Focus survey forecasts inflation of 3.91 percent in 2026 and 3.80 percent in 2027.

After expanding by an estimated 2.5 percent in 2025, its slowest growth since 2020, the economy is expected to remain on a moderate growth path. Meanwhile, the Brazilian real has appreciated against the U.S. dollar and is currently trading near R\$5.18 per US\$1. The exchange rate is forecast to average at R\$5.45 per US\$1 in 2026 and R\$5.50 per US\$1 in 2027, which could modestly increase the competitiveness of Brazilian soybean exports.

In addition, high interest rates in Brazil, currently at 14.75 percent, are one of the main impediments limiting producers to invest in their overall operations.

Figure 4
Historical Basic Interest Rate (February 2024 – June 2026 Selic % a.a.)

Source: Brazilian Central Bank | Chart generated by Post Brasilia - Office of Agricultural Affairs (OAA).

COST OF PRODUCTION

Brazilian soybean producers are ending the 2025/26 season facing higher production costs. According to the Mato Grosso Institute of Agricultural Economics (IMEA), total soybean production expenses in Mato Grosso were estimated at R\$7,651.51 per hectare in MY 2025/26, an increase of approximately 7.9 percent from the previous season.

The rise was primarily driven by higher fertilizer and labor costs. Post contacts anticipate the cost of production to remain high into MY 2026/27, mainly due to recent increases in oil prices and other inputs directly impacted by recent geopolitical conflicts.

Figure 5

Cost of Soybean Production in Mato Grosso (MY 2021/22 – MY 2025/26)*

Marketing Year	2021/22	2022/23	2023/24	2024/25	2025/26*

PRICES

After a moderate increase in soybean prices in May, the Center for Advanced Studies on Applied Economics (CEPEA) soybean price index at the Port of Paranaguá recorded three consecutive declines in the domestic market, currently standing at US\$25.91 per 60-kg sack. In Chicago, soybean futures also fell after two weeks of gains, contrary to initial market expectations.

Global soybean stocks remain relatively tight, and rising demand for soybean oil used in biofuels would, in theory, be expected to support higher prices. However, this has not occurred. According to sector specialists, the main reason is the unpredictability of the global geopolitical environment.

Figure 6

Soybean Prices at the Port of Paranaguá in (2015-2026)

Source: Center for Advanced Studies on Applied Economics (CEPEA) data | Chart elaborated by Post Brasilia - Office of Agricultural Affairs (OAA).

DOMESTIC CONSUMPTION & PROCESSED PRODUCTS

Brazil's soybean crushing in MY 2026/27 was revised to 62.5 MMT, up 2.4 percent from MY 2025/26 estimates, supported by projected available supply and steady domestic demand for meal and oil, though growth is slower than the prior season.

Soybean meal production is forecast at 47.4 MMT for MY 2026/27, while consumption is expected to rise, supported by stronger livestock demand. Soybean oil output is forecast at 12.8 MMT, with a steady

increase in domestic consumption due to biodiesel blending mandates, despite the delay of B16, which was initially scheduled for March 2026.

Overall, crushing growth is expected to remain modest, below the five-year average, due to policy uncertainty and a more gradual expansion in biodiesel demand. However, COFCO's recently announced investment of over US\$400 million to expand its plant in Rondonópolis, Mato Grosso, is expected to transform the facility into the largest soybean crushing complex in Brazil, with a significant impact on national processing capacity and consumption.

The project is intended to boost local soybean processing capacity while reinforcing the company's industrial presence in a key regional hub for production, storage, and logistics.

Currently, the facility processes approximately 4.5 thousand MT of soybeans per day. Once the expansion is completed, capacity is projected to rise to around 10 thousand MT per day. The plant currently produces soybean meal, soybean oil, and biodiesel, which are central products in the company's operations in the region.

TRADE

Brazil's Soybean Exports on track for Another Record in 2026/27

Post forecasts MY 2026/27 soybean exports to reach 117.5 MMT, an increase of 2.1 percent compared to the current season revised estimates, currently at 115 MMT.

The projected increase is primarily driven by available supply and steady demand from the People's Republic of China (PRC), although it is expected to be more moderate than in previous seasons. This is mainly due to global trade agreements that may favor other soybean-producing countries, such as Argentina, as well as the anticipated growth in domestic processing in the coming years.

The PRC remains the main destination for Brazilian soybeans. In 2025, Brazil exported a record 108.1 MMT of soybeans, up 9.5 percent from the previous year. Of this total, 85.4 MMT, or 78.9 percent of total exports, was destined to the PRC.

So far in 2026, March was the only month in which exports to the PRC were lower compared to the same period in the previous year. This decline can be attributed to a combination of factors, including market diversification and stock management. However, exports to the PRC increased in April and May, bringing cumulative 2026 shipments to comparable levels as the same period last year.

Figure 7
Brazil’s Monthly Soybean Exports to the PRC Comparison (2024 – 2026)

Source: Brazil Ministry of Development, Industry and Trade | Chart elaborated by Post Brasilia Office of Agricultural Affairs (OAA).

Brazil’s overreliance on the Chinese market is major a concern, as even small future changes in the PRC’s consumption levels and overall demand could significantly impact Brazil’s export performance.

In order to improve market security, in addition to the expansion in domestic processing, the country is expected to intensify trade negotiations in MY 2026/27 to regain market share in strategic regions.

Soybean Oil Exports

Post maintains its MY 2026/27 forecast for Brazil’s soybean oil exports at 1.7 MMT, up 6.2 percent from the current season’s estimate of 1.6 MMT.

A recovery in demand from India, along with stronger demand from Iran, Thailand, and other markets, has supported higher export volumes during this period of the year. So far in 2026, Brazil has exported 11.1 MMT of soybean oil, an increase of 8.8 percent compared to the same period last year.

Soybean Meal Exports

Post revises Brazil’s soybean meal exports to 26 MMT in MY 2026/27, up 1 MMT from the previous forecast and 6.1 percent from current season estimates of 24.5 MMT. This level of exports reflects

relatively steady year-over-year growth, driven primarily by demand from Southeast Asia and the E.U., which could be further supported by new trade ties under the E.U.-Mercosur free trade agreement.

Although soybean products already benefit from relatively favorable market access to the E.U., the agreement could strengthen commercial relationships, improve logistics, reduce non-tariff barriers, and encourage new long-term trade contracts and investment, potentially supporting additional trade over time.

Over the past few years, Brazil has expanded access to new markets with strong and consistent demand for soybean meal, while also strengthening its position in existing destinations through new and updated trade arrangements.
