Date: July 01, 2026

Report Number: MY2026-0009

Report Name: Oilseeds and Products Update

Country: Malaysia

Post: Kuala Lumpur

Report Category: Oilseeds and Products

Prepared By: Mohd Syafiee Mohd Sait

Approved By: Katherine McBride

Report Highlights:

Malaysia's palm oil sector is expected to face a challenging production environment in Marketing Year (MY) 2026/27 as industry stakeholders monitor the potential effects of El Niño-related dry weather conditions on oil palm fields. While production in MY2025/26 has remained stronger than anticipated, during the first eight months of the marketing year, weather-related challenges are expected to lead to moderate production growth in the following year. Meanwhile, domestic palm oil demand is projected to strengthen following the incremental implementation of Malaysia's B15 biodiesel mandate that has started on June 1, 2026, with the first full-year impact expected to be in MY2026/27. On the other hand, U.S. soybean oil prices have continued to rise and remain at a substantial premium to palm oil while palm oil's discount to Argentinean and Brazilian soybean oil is weakened, leading to a competitive global vegetable oil market.

Executive Summary

Palm Oil

Palm oil production in MY2025/26 is revised upward following stronger output during the first eight months of the marketing year, with cumulative production exceeding the corresponding period in MY2024/25 by more than one million metric tons (MT). Assuming seasonal production patterns remain broadly consistent throughout the remainder of the marketing year, production is expected to exceed the earlier forecast. Production in MY2026/27 is expected to be moderate due to dry weather conditions associated with an expected El Niño starting June 2026, which is forecast to affect fresh fruit bunch (FFB) yields. Similarly, production across the palm kernel complex is expected to moderate in MY2026/27 as lower FFB yields reduce palm kernel availability for crushing. Consequently, production of palm kernel meal (PKM) and palm kernel oil (PKO) is also forecast to decline modestly from MY2025/26 levels. In the meantime, domestic consumption is expected to increase following the implementation of Malaysia's B15 biodiesel mandate, with the first full-year impact expected to be in MY2026/27. Stronger domestic consumption is expected to slow stock accumulation, yet supplies are projected to remain sufficient to support both domestic requirements and export demand.

Soybeans

Malaysia's soybean sector remains heavily dependent on imports to support domestic crushing and feed demand. Soybean imports and consumption in MY2025/26 are revised lower due to slower import arrivals and elevated soybean prices, resulting in reduced crushing activity and lower soybean meal and soybean oil production. Nevertheless, demand from the poultry sector continues to support soybean meal consumption, while competitive soybean oil prices relative to palm oil are expected to limit growth in soybean oil consumption.

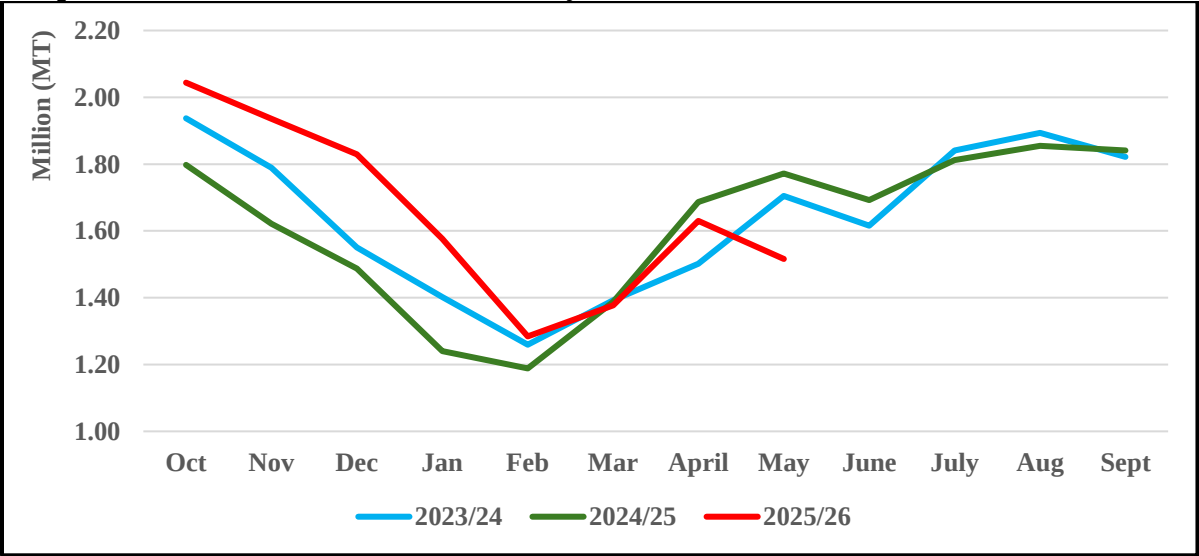

Palm Oil

Production

Post lowers the palm oil production estimate for MY2026/27 to 19.7 million MT from the previous forecast based on the expectations of dry weather conditions associated with [El Niño from June 2026 well into 2027](#). Dry conditions are expected to limit FFB yields during the marketing year. As oil palm productivity typically responds several months after periods of moisture stress, the impact is expected to be reflected in the third and fourth quarter of MY2026/27.

Post’s projection for MY2025/26 palm oil production is 20 million MT, an increase of 300 thousand MT driven by stronger than expected output throughout the first eight months of the marketing year compared to the corresponding period in MY2024/25. Cumulative production from October 2025 to May 2026 exceeded the corresponding period in MY2024/25 by more than one million MT. Although production slowed in April and May compared to MY2024/25, the stronger production base established in earlier months is expected to support a larger total production figure for the MY.

Graph 1: Production of Palm Oil in Malaysia from MY2023/24 to MY2025/2

Source: Malaysia Palm Oil Board

Area harvested projections are at 5.16 million hectares in MY2026/27 and 5.15 million hectares in MY2025/26, unchanged from the previous estimate, to align with Malaysian Palm Oil Board (MPOB) data.

Consumption

Post’s projection for MY2026/27 palm oil consumption is an increase of 330 thousand MT to 4.59 million MT. According to MPOB, the transition from B10 to B12 is expected to increase annual palm oil demand by approximately 130 thousand MT, while the subsequent expansion to B15 could add a

further 204 thousand MT¹. The revised estimate reflects higher industrial consumption during the first full marketing year of Peninsular Malaysia's B15 biodiesel mandate, which is expected to increase palm oil utilization by biodiesel producers.

Post estimates domestic consumption in MY2025/26 at 4.35 million MT, an increase from the previous projection. This adjustment reflects higher industrial consumption following the implementation of [B15 biodiesel mandate on June 1, 2026](#). As the mandate is only implemented during the final months of the marketing year at an incremental pace, the increase is expected to be more limited compared to MY2026/27.

Food use estimates are forecast to remain unchanged at 950 thousand MT in MY2026/27 and 940 thousand MT in MY2025/26 respectively, reflecting stable household and food manufacturing demand.

Trade

Import

Post raises MY2026/27 palm oil imports to 550 thousand MT, reflecting lower production and higher domestic consumption forecasts associated with the Peninsular Malaysia's B15 biodiesel mandate. Additional imports are expected to supplement domestic supplies in addition to a drawdown in stocks.

Post revises the palm oil import estimate for MY2025/26 upwards to 550 thousand MT on higher imports during the first eight months of the MY compared to previous expectations. Imports reached approximately 290 thousand MT between October 2025 and April 2026 and are expected to exceed earlier projections assuming current trade patterns continue through the remainder of the marketing year². The increase in the import estimate reflects stronger than expected regional supply availability from Indonesia. Market participants reported that uncertainty surrounding [Indonesia's new palm oil governance](#) framework encouraged exporters to accelerate shipments during MY2025/26.

Export

Post maintains the MY2026/27 palm oil export estimate at 15.9 million MT, unchanged from the previous estimate. Export demand is expected to be supported by constant purchases from key countries, like India, Kenya, and China. However, export growth may be constrained by continued competition from Indonesia, a weakened price discount, and higher domestic consumption associated with Malaysia's B15 biodiesel mandates.

The palm oil export estimate for MY2025/26 is revised higher at 15.75 million MT compared to the previous estimate. The revision reflects higher export performance during the first eight months of the marketing year. Palm oil remains competitively priced relative to soybean oil, particularly U.S. soybean oil, supporting demand from price-sensitive markets like India.

¹ [Malaysia's palm oil-based biodiesel push to add 300,000 tons in demand, says MPOB – MPOC](#)

² Data from Trade Data Monitor

Stocks

Post revises the stocks estimate for MY2026/27 down to 2.56 million MT. The revision reflects higher domestic consumption associated with the first full marketing year of the B15 biodiesel mandate and lower production.

Ending stocks for MY2025/26 are revised upwards to 2.8 million MT from previous estimate as higher production and imports more than offset increases in domestic consumption and export.

Palm Kernel

Production

Post revises MY2026/27 production down to 4.63 million MT to account for El Niño impacts on FFB yields. The production estimate in MY2025/26 is revised upward to 4.65 million MT driven by higher FFB and palm complex production during the first eight months of the marketing year.

Consumption

Post estimates total domestic consumption in MY2026/27 to remain unchanged at 4.75 million MT, from a stable crushing activity. Crush projections for MY2025/26 are revised upward to 4.78 million MT from stronger local production during the first eight months of the marketing year.

Trade

Post projects imports in MY2026/27 to increase to 120 thousand MT from the previous estimate on lower production. The imports estimate in MY2025/26 is unchanged, reflecting adequate regional supply availability and domestic crushing demand.

Post's exports estimate for palm kernel in MY2026/27 is unchanged from the previous estimate at six thousand MT. Export volumes are expected to return to more typical levels following stronger than expected shipments in MY2025/26. Post has revised the palm kernel estimate in MY2025/26 upward to seven thousand MT to align with Trade Data Monitor (TDM). The data indicate higher shipments to India and Thailand during the period.

Stocks

The ending stocks estimate for MY2026/27 is reduced to 257 thousand MT, as reduced production outweighs the increase in imports.

Post revises the ending stocks estimate for MY2025/26 downwards to 268 thousand MT. Higher production is expected to be largely absorbed by increased crush activity and exports, resulting in a slight reduction in ending inventories.

Palm Kernel Meal

Production

The production estimate for PKM in MY2026/27 is revised downwards to 2.46 million MT following the downward revision in palm kernel production, reflecting the expected impact of dry weather

associated with El Niño on FFB yields. Post revises the PKM estimate for production in MY2025/26 upwards to 2.49 million MT, from an increase in the forecast of palm kernel production.

Consumption

Estimates for total domestic consumption of PKM in all three markets year are unchanged.

Trade

Post maintains the PKM import estimate in MY2026/27 is at 10 thousand MT, unchanged from the previous estimate. Imports are expected to remain broadly in line with historical trade levels, with Indonesia continuing to serve as Malaysia's primary supplier of palm kernel meal. The PKM estimate for imports in MY2025/26 is revised upward to 14 thousand MT following a substantial increase in imports from Indonesia during the first seven months.

Post maintains the MY2026/27 PKM export estimate at 2.41 million MT, unchanged from the previous estimate. Export demand is expected to remain supported by continuous purchases from key markets, including China, New Zealand, and South Korea. Post adjusts up the MY2025/26 PKM export estimate to 2.5 million MT from the previous estimate of 2.4 million MT, reflecting stronger export performance during the first eight months of the marketing year and to align with MPOB export data.

Stocks

The stocks estimate for MY2026/27 is revised downward to 181 thousand MT from lower beginning stocks, not offset by imports. The ending stocks estimate in MY2025/26 is also lowered to 179 thousand MT, reflecting an increase in the exports forecast outpacing an increase in forecasted imports.

Palm Kernel Oil

Production

Post projects MY2026/27 PKO production to reduce to 2.21 million MT reflecting lower palm kernel availability for crushing following the downward revision in palm kernel production.

Post revises the production estimate in MY2025/26 upwards to 2.24 million MT. The revision reflects higher-than-expected palm kernel availability following higher palm oil production recorded during the first eight months of the marketing year.

Consumption

Post estimates total domestic consumption in MY2026/27 and MY2025/26 to remain unchanged at 1.25 million MT and 1.24 million MT, respectively.

Trade

The estimate for imports of PKO in MY2026/27 is forecast to remain unchanged at 180 thousand MT, as higher beginning stocks are expected to reduce the need for additional imports while continuing to meet domestic requirements. Import projections for MY2025/26 are also kept unchanged at 180 thousand MT, to align with TDM data.

Post revises the MY2026/27 PKO export estimate to 1.18 million MT, reflecting higher beginning stocks and sufficient supplies for export. Post reduces MY2025/26 PKO export estimate to 1.1 million MT from the previous estimate of 1.15 million MT, reflecting lower export volumes recorded in January and February of the marketing year based on MPOB data. Assuming seasonal export patterns remain consistent with previous years, exports are expected to remain below earlier projections throughout the remainder of the marketing year.

Stocks

Post revises the ending stocks estimates for MY2026/27 upward to 318 thousand MT, as higher beginning stocks are expected to outpace changes in exports. Post estimates ending stocks for MY2025/26 are higher at 358 thousand MT, reflecting higher production and lower exports compared to March forecasts.

Soybean

Production

Production estimates for all marketing years remain unchanged as Malaysia does not commercially produce soybeans.

Consumption

Post maintains the MY2026/27 soybean consumption estimate at 733 thousand MT, unchanged from the previous estimate. Although beginning stocks are revised lower, available supplies are expected to remain sufficient to support domestic crushing and food use requirements.

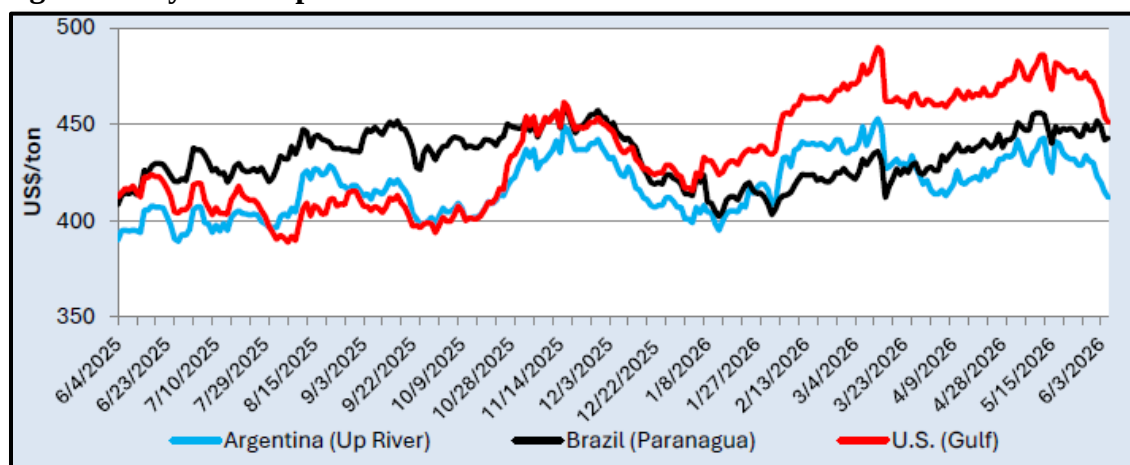

Post lowers MY2025/26 soybean consumption estimate to 713 thousand MT reflecting a reduction in crush volumes following lower soybean import expectations.

Trade

Post revises the MY2026/27 soybean import estimate slightly lower to 725 thousand MT, a reduction of two thousand MT from the previous estimate. Imports are expected to remain constrained by reduced export availability from major soybean-producing countries, as a larger share of soybean supplies is increasingly directed toward domestic crushing to support biofuel production.

Post revises the MY2025/26 soybean import estimate down to 700 thousand MT from the previous estimate of 725 thousand MT. Data reported for soybean imports between February and April were lower than anticipated due to logistical challenges and shipping disruptions.

Figure 1: Soybean Export Prices

Source: Oilseeds: World Markets and Trade June 2026

Post maintains MY2026/27 and MY2025/26 soybean export estimates. Malaysia is not a significant soybean exporter, and export activity remains limited relative to import volumes and domestic utilization.

Stocks

Post estimates ending stocks for soybeans in MY2026/27 to decline to 33 thousand MT. Lower forecasted beginning stocks and imports were not offset by unchanged domestic consumption, resulting in reduced ending stocks.

The stocks estimate for MY2025/26 is revised downwards to 49 thousand MT. The revision reflects expected lower imports during the marketing year, which more than offset the reduction in domestic consumption.

OFFICIAL DATA CAN BE ACCESSED AT: [PSD Online Advanced Query](#)

Soybean Meal

Production

Post's projects production for soybean meal in MY2026/27 to remain unchanged. Production is expected to remain stable as domestic soybean crushing activity remains unchanged from earlier estimates.

The production estimate for soybean meal in MY2025/26 is forecast to decrease from previous estimate to 395 thousand MT from lower soybean imports.

Consumption

Post's domestic consumption estimate for soybean meal in MY2026/27 is forecast to increase to 1.66 million MT. The revision reflects expanding demand from Malaysia's livestock sector, particularly poultry production, which remains the largest consumer of soybean meal. Feed demand is expected to strengthen as livestock producers continue to expand production, supported by growth opportunities arising from Malaysia's self-sufficiency ratio remaining is still below 100 percent.

Post maintains the MY2025/26 soybean meal consumption estimate at 1.65 million MT, unchanged from the previous estimate. Industry stakeholders reported steady feed demand during the marketing year, supported primarily by the poultry sector. Malaysia's poultry industry continues to maintain a high level of self-sufficiency, supporting consistent demand for feed ingredients, including soybean meal. On the other hand, demand growth from the swine sector remains more limited. Industry stakeholders noted that [uncertainty surrounding the future expansion of pig farming operations, particularly in Selangor](#), may constrain growth in feed demand from the sector.

Trade

MY2026/27 and MY2025/26 import estimates are unchanged from the previous estimate. Trade data throughout the first eight months of the marketing year indicate that imports remain broadly consistent with previous expectations.

Post's projection for exports of soybean meal in MY2026/27 is unchanged at 80 thousand MT from the previous estimate. Increased global soybean meal supplies resulting from higher crush volumes in major producing countries are expected to maintain downward pressure on prices and increase competition in regional markets, limiting export opportunities for Malaysian soybean meal.

Post revises MY2025/26 soybean meal exports upward to 95 thousand MT from the previous estimate of 90 thousand MT. Official trade data show exports approximately 30 percent higher year-on-year through April 2026, supported primarily by increased shipments to Myanmar. However, the pace of export growth is expected to moderate during the remainder of the marketing year, resulting in only a modest upward revision to the full-year export forecast.

Stocks

Post revises the stocks estimate for MY2026/27 downward to 163 thousand MT on lower carry-in stocks and slightly higher domestic consumption.

The stocks estimate for MY2025/26 is decreased to 153 thousand MT. The revision reflects lower production, and stronger export demand reduces carryout inventories.

Soybean Oil

Production

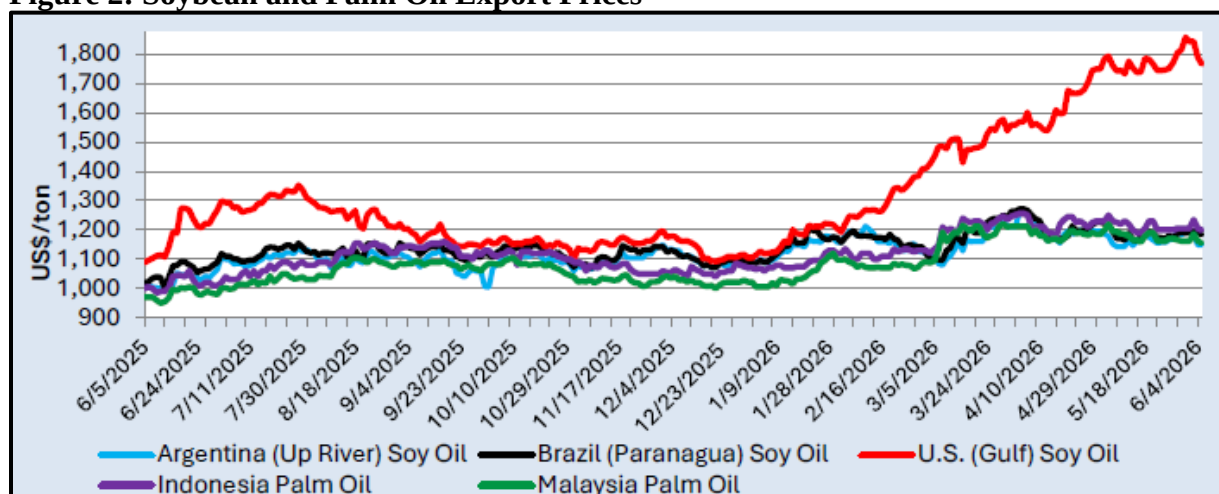

Post projects production for MY2026/27 soybean oil production unchanged at 93 thousand MT as soybean crushing activity remains unchanged from earlier expectations.

Post lowers the production estimate for soybean oil in MY2025/26 to 90 thousand MT. The revision reflects a lower soybean crushing forecast during the marketing year.

Consumption

Domestic consumption estimates for soybean oil are revised downward to 75 thousand MT in both MY2025/26 and MY2026/27. Soybean oil continues to face strong competition from domestically produced palm oil, which remains the preferred edible oil in Malaysia due to its widespread availability and competitive pricing.

Trade

Post projects MY2026/27 soybean oil imports to increase to 98 thousand MT from the previous estimate as higher export and lower beginning stocks require additional imports to maintain adequate domestic supplies. The import estimate in MY2025/26 is revised upwards to 100 thousand MT to align with official data. The increase was driven primarily by higher imports from China and Taiwan.

Post forecasts exports in MY2026/27 at 118 thousand MT to align with the higher trade baseline established in MY2025/26 and expects demand will remain supported by continued purchases from key regional markets like the Philippines and Indonesia. Post revises the soybean oil export estimate in MY2025/26 to 117 thousand MT to align with official data based on stronger export performance during the first seven months of the marketing year. While recorded exports were 26.7 percent higher year-on-year through April 2026, export growth is expected to moderate during the remainder of the marketing year as higher global edible oil prices are expected to temper purchasing activity among regional importers in the market.

Stocks

Post maintains MY2026/27 soybean oil ending stocks estimates at 4 thousand MT. Higher imports are expected to offset lower beginning stocks and stronger export demand, keeping inventories broadly unchanged.

Post projects the stocks estimate for MY2025/26 to remain unchanged at 6 thousand MT as higher stocks, imports, and lower domestic consumption are expected to offset lower production and higher exports, keeping ending stocks unchanged.

Table 7: Production, Supply and Distribution for Soybean Oil 2024/25-2026/27

Oil, Soybean Market Year Begins Malaysia	2024/2025		2025/2026		2026/2027
