Date: December 08, 2025

Report Number: MY2025-0013

Report Name: Oilseeds and Products Update

Country: Malaysia

Post: Kuala Lumpur

Report Category: Oilseeds and Products

Prepared By: Mohd Syafiee bin Mohd Sait

Approved By: Alicia Hernandez

Report Highlights:

Malaysia's palm oil production is forecast at 19.5 million metric tons (MT) in MY2025/26, with export estimates rising to 16.2 million MT as demand in African markets grows and Indonesia's B40 mandate limits regional supply. Structural challenges persist, with replanting at only 1.8 percent versus the 4 percent target, though mechanization and research and development are improving yields. For MY2025/26, soybean imports are projected at 715 thousand MT, while soybean meal consumption climbs to 1.69 million MT, driven by poultry feed as African Swine Fever (ASF) continues to weaken swine demand. Soybean oil output estimate in MY2025/26 remains modest at 89 thousand MT with flat consumption in a competitive oilseeds market dominated by palm oil.

Executive Summary

Palm Oil

Malaysia's palm oil production for Marketing Year (MY) 2025/26 is forecast at 19.5 million MT, supported by normal weather, replanting incentives, and gradual mechanization, while MY2024/25 output is revised up to 19.3 million MT after stronger-than-expected yields. Labor availability remains critical, but government measures to secure foreign workers and the transition to MSPO 2.0 standards are expected to strengthen field management practices. Estimates of domestic consumption of palm oil in MY2025/26 increased to 3.635 million MT while it remains unchanged for MY2024/25. Export estimates are raised to 16.2 million MT in MY2025/26, supported by expected stronger production, steady African demand, and reduced Indonesian exportable supply under the B40 mandate, while MY2024/25 exports are revised up to 15.85 million MT. Stocks are revised slightly upwards to 2.344 million MT in MY2025/26 as stronger supply outpaced exports.

The palm kernel production forecast is raised to 4.59 million MT in MY2025/26, with higher fresh fruit bunch (FFB) yields, improved harvesting, and stronger labor availability supporting growth. Most palm kernels are crushed domestically, leaving little surplus for export.

Palm kernel meal (PKM) production is projected to rise compared to previous estimates to 2.36 million MT in MY2025/26, supported by higher crush volumes and efficiency upgrades at crushing facilities. Domestic use remains negligible, so nearly all PKM is exported, with key markets in China, New Zealand, South Korea, and the Middle East.

Palm kernel oil's (PKO) production forecast is increased to 2.145 million MT in MY2025/26 on higher kernel availability and improved extraction efficiency. Domestic use is revised upwards at 1.24 million MT, driven by food processing, while exports are expected to strengthen on higher output and growing demand from Asia and South Asia.

Soybean

Malaysia produces no soybeans and is fully dependent on imports, which are revised upwards in MY2025/26 to 715 thousand MT. Soybean consumption estimates are increased to 723 thousand MT in MY2025/26 and 721 thousand MT in MY2024/25, regardless of swine feed demand having a slight decline due to ASF. Imports supply all soybean needs, with the United States as the main supplier, followed by Canada and Brazil. As for soybean meal, consumption is projected at 1.65 million MT in both marketing years, with poultry feed as the dominant driver. Argentina and the United States are the two main exporters to Malaysia. Imports typically fluctuate depending on price competitiveness against regional suppliers to cater to feed millers that are seeking high-protein meal for the poultry, swine, and aquaculture sectors. For soybean oil, China and Thailand are the primary suppliers, and exports remain minimal. Stocks of soybeans and soybean meals are expected to edge higher, reflecting strong imports and steady crushing activity.

Palm Oil

Production

The production estimate for MY2025/26 is forecast at 19.5 million MT. The increase from the previous estimate reflects assumptions of normal weather and continued support from government policies. Incentives for replanting and the gradual rollout of mechanization programs are expected to help estates and smallholders increase productivity and yields.

As for MY2024/25, production has been revised upward by 200,000 MT to 19.3 million MT, as output during the first 10 months of the marketing year exceeded earlier expectations and normal weather patterns are assumed for the rest of the year.

Graph 1: Production of Palm Oil

Source: Malaysia Palm Oil Board

Production typically dips between December and February before rebounding sharply from March until September. The estimate is for the MY2024/25 production to surpass previous years during the late season.

Labor availability is one of the most important factors in the production of palm oil. Harvesting and upkeep of palm oil are highly labor intensive, and shortages that have persisted since COVID have led directly to unharvested and uncollected fruit and resulted in lower yields. To address this issue, the government has stepped up efforts to secure and regularize foreign workers.¹ A steadier workforce allows estates to intensify field maintenance, keep harvesting cycles on time, and move FFBs to mills within the same day. Reliable access to workers also makes it easier for companies to replant older trees with higher-yielding varieties.

The move from MSPO 1.0 to MSPO 2.0, spurred by international market needs and regulations such as the European Union Deforestation Regulation, sets higher standards for environmental care, labor rights,

¹ [Malaysia Approves Over 34,000 Quotas for Foreign Plantation Workers](#)

and traceability. Certification under MSPO 1.0 was mainly focused on plantations and mills, whereas MSPO 2.0 strengthens those requirements and extends coverage to processors and dealers, creating consistency across the supply chain. For producers, this practice means closer attention to sustainable field practices, fair treatment of workers, and the need to carry out social impact assessments. With government support through training, group certification, and the *Jom MSPO 2.0* campaign, smallholders are better able to meet these requirements. In practice, these changes encourage better farm management and reduce risks linked to poor practices. Sabah and Sarawak together account for more than half of Malaysia's total planted area. Both are considered as new planting states compared to Peninsular Malaysia. While Sarawak records lower yields due to peat soils and harvesting challenges during the rainy season, in Peninsular Malaysia, Johor, and Perak remain among the top producing states.

National replanting rates are still well below the 4 percent target, with current progress at only 1.8 percent. Replanting has been slow largely because smallholders are reluctant to remove older, income-generating trees. Many are elderly farmers who rely on support from their children and other income sources, treating palm oil as a secondary rather than a primary livelihood.

Mechanization is gradually expanding, with estates adopting drones, automated sprayers, and field sensors, though harvesting still depends heavily on manual labor. Major producers have begun applying digital tools and mechanized equipment to improve field management. These efforts have helped raise efficiency and push yields achieving 20.6 MT per hectare, compared with the national average of around 19 to 20 MT per hectare.

Consumption

The total domestic consumption estimate for MY2025/26 has been revised upwards to 3.635 million, an increase of 60 thousand MT. The industrial domestic consumption estimate is revised upwards to align with the MY2024/25 estimate, 2.71 million MT. On the other hand, food use and feed waste domestic consumption has remained unchanged.

The total domestic consumption estimates for MY2024/25 remain unchanged at 3.63 million MT.

Trade

Imports

The import forecast for MY2025/26 is lowered to 250 thousand MT as stronger domestic production is expected to keep Malaysia largely self-sufficient. Indonesia's expanding biodiesel mandate is also tightening its export supply, reducing regional stock availability.

In contrast, the import estimate for MY2024/25 is revised higher to 600 thousand MT, reflecting stronger imports from Indonesia, which increased fourfold compared to the same period in MY2023/24.

Exports

Post revises the export forecast for MY2025/26 upward to 16.2 million MT, compared to the earlier projection of 16.0 million MT. The increase reflects higher production and beginning stock estimates. Export prospects are further supported by Indonesia's B40 biodiesel mandate, which diverts more of its

production to domestic energy use, thereby reducing its exportable supply and creating additional opportunities for Malaysia to expand shipments.

Graph 2: Export of Palm Oil to Selected African Countries

Source: Trade Data Monitor

Malaysia’s export outlook is also buoyed by demand from African markets, like South Africa, Tanzania, and Kenya where there is an increasing trend of imports. On the policy front, stakeholders highlight that bilateral cooperation with Turkey under the Comprehensive Strategic Partnership signed in 2022, and the bilateral ties that have been addressed during the early period of 2025, have opened new avenues for market growth and strengthened Malaysia’s [general trade relationship](#)².

² Malaysia and Turkey signing 11 agreements

Graph 3: Price of Crude Palm Oil

Source: Malaysian Palm Oil Board

Post revises the export estimate for MY2024/25 upward to 15.85 million MT, incorporating the latest data from the Malaysian Palm Oil Board (MPOB) and assuming the final month of the marketing year will follow historical shipment patterns. Crude palm oil prices in MY2024/25 were higher than MY2023/24, peaking above [RM5,000/MT³ \(USD 1,157\)](#) early in the year before easing towards [RM4,000/MT⁴ \(USD925\)](#). Previously, palm oil traded at a premium throughout early MY2024/25 but it has now returned to being a discounted oil compared to other vegetable oils.

Stocks

The stock estimate for MY2025/26 is forecast at 2.34 million MT, an increase of 40,000 MT from the previous estimate. Production and beginning stocks are expected to be higher, and outpaced stronger exports combined with higher total domestic consumption resulting in an increase in overall stock levels.

For MY2024/25, the ending stocks estimate has been revised upward to 2.43 million MT. The revision reflects higher production and imports relative to exports, while domestic consumption remains unchanged. This adjustment indicates a short-term build-up in inventories, though much of the surplus is expected to be drawn down in the following marketing year as exports are forecasted to increase further.

Palm Kernel

Production

Post's production estimate for palm kernel in MY2025/26 has increased to 4.59 million MT, reflecting expectations of higher output from the oil palm under the assumption of normal weather conditions. The upward revision also considers improved harvesting efficiency, better FFB yields, and the availability of sufficient labor supply to support timely collection and processing.

The production estimate for MY2024/25 is also projected to rise to 4.57 million MT, supported by strong palm kernel production recorded for the past six months and the expectation of normal weather for the remainder of the year. These revisions are consistent with higher production at the field level, reinforced by industry reports highlighting improved estate management practices and improved harvesting activities.

Consumption

The palm kernel crush estimate for MY2025/26 is revised upward to 4.6 million MT, reflecting higher local production. Almost all palm kernel is directed into the crush sector, as food use and feed waste consumption of palm kernel in Malaysia are negligible while a very small amount of it is exported

For MY2024/25, Post has also revised the crush projection upward to 4.59 million MT, in line with raised production estimates and higher import projections.

Trade

Imports

The palm kernel import estimate for MY2025/26 is forecast to reduce by ten thousand MT to 40 thousand MT, in line with higher local production and higher beginning stocks that reduces the need for external supplies.

Exports

Post forecasts palm kernel exports for MY2025/26 to decline while estimate for MY 2024/25 to remain unchanged from previous estimates. Most palm kernels are processed domestically, crushed into palm kernel oil (PKO) and palm kernel meal (PKM) which limits the volume available for export.

For MY2024/25, Post has revised the import estimate upward to 90 thousand MT, reflecting official data. The sharp rises were concentrated between March and July, driven largely by higher volumes arriving from Thailand during this period.

Stocks

The ending stock for MY2025/26 and MY2024/25 are revised up to 286 thousand MT and 256 thousand MT, respectively. Ending stocks in both marketing year estimates are projected to increase as the rise in total supply outpaces the growth in domestic consumption and exports.

Palm Kernel Meal

Production

Post revises upward the production estimate for MY2025/26 to 2.36 million MT, in line with the projected increase in palm kernel crush. In addition to higher kernel availability, production prospects are also supported by automation and digital monitoring systems being adopted in some crushing plants. These technologies help optimize processing conditions such as temperature, pressure, and throughput, resulting in higher efficiency and reduced losses. At the same time, improved separation and drying systems enhance PKM quality by lowering impurities and moisture levels, making the meal more attractive for feed markets. The industry is also upgrading older mills to comply with MSPO certification standards, which indirectly raises efficiency and recovery rates, contributing to better PKM output growth.

For MY2024/25, the production estimate has also been revised upward to 2.35 million MT, reflecting stronger palm kernel production and higher crush projections. The revision is further reinforced by industry reporting that some crushers are setting higher utilization targets and efficiency level in producing PKM.

Consumption

Post maintains the estimate for total domestic consumption at the same level as the previous forecast, 55 thousand for MY2025/26 and 52 thousand for MY2024/25. Year-over-year consumption continues to show an upward trend. This is driven by the gradual expansion of the cattle and dairy sectors which support steady demand for feed ingredients, particularly palm kernel meal. As these sectors grow, even at modest pace, PKM remains a cost-effective protein source in feed rations, reinforcing consistent domestic use. However, PKM's higher fiber and lower protein content compared to soybean meal restricts its suitability for poultry and swine feed, which dominates the domestic feed market. As a result, a significant amount of PKM produced in Malaysia is directed to export markets where demand is stronger and more consistent.

Trade

Imports

The import estimate for MY2025/26 is forecast to remain unchanged, even with higher local output from increased palm kernel crushing. Imports of PKM into Malaysia are typically marginal, usually below only a thousand MT or less in a year and occur only to cover temporary supply gaps or meet specific customer needs. Shipments, when recorded, have come from nearby suppliers such as Indonesia, Thailand, and Papua New Guinea.

For MY2024/25, Post increases the import estimate to 3 thousand MT, to align with official figures. Overall, PKM trade on the import side remains minimal.

Exports

The post forecast PKM exports in MY2025/26 to rise to 2.3 million MT, higher than earlier estimates. Exports remain the main outlet for Malaysia's PKM, with a large proportion of production shipped abroad. Key markets include New Zealand, China, South Korea, and the Middle East, where PKM is valued in cattle and dairy feed for its high fiber and moderate energy content. Demand in these markets is generally steady but shifts with the relative price of competing meals.

Graph 4: Exports of Palm Kernel Meal from Malaysia

Source: Trade Data Monitor

For MY2024/25, the export forecast is unchanged, reflecting MPOB data showing shipments in line with the previous marketing year.

Stocks

The post forecast for stocks ending in MY2025/26 is raised to 138 thousand MT, as higher beginning stocks combined with gains in production outpaced the increase in exports and unchanged domestic consumption.

For MY2024/25, the stock estimate has been adjusted upward to 133 thousand MT, as higher production outpaced unchanged exports and domestic consumption.

Palm Kernel Oil

Production

The production of palm kernel oil in MY2025/26 is forecast at 2.145 million MT, an increase of 35,000 MT from earlier estimates. This reflects upward revisions in FFB production, which in turn leads to higher palm kernel crushing volumes, as well as improved efficiency at some crushing facilities where better processing technology has enhanced oil extraction rates.

The forecast for MY2024/25 is also raised to 2.13 million MT, reflecting stronger-than-previously expected palm kernel output during the marketing year and the assumption of continued normal weather conditions.

Consumption

The total domestic consumption estimate for MY2025/26 is forecast to increase to 1.24 million MT. The upward trend is driven by modest demand from the food processing sector PKO is widely used in the production of margarine, ice cream, confectionery fats, and specialty fats, where it competes directly with coconut oil. For example, local confectionery and bakery manufacturers continue to prefer PKO when coconut oil prices remain elevated, given its cost competitiveness and functional similarity.

The total domestic consumption estimate for MY2024/25 remains unchanged, reflecting marginal demand fluctuations in industrial and food-use demand.

Trade

Imports

The import estimate for MY2025/26 is forecast to decline to 150 thousand MT, a reduction of 10 thousand MT from the previous estimate. With Indonesia set to enforce its B40 biodiesel mandate in 2026, more of its palm oil production will be diverted to domestic consumption, tightening global availability. Indonesia is the second-largest supplier of PKO to Malaysia.

The import estimate for MY2024/25 remains unchanged, consistent with official data.

Graph 5: Imports of Palm Kernel Oil to Malaysia

Source: Trade Data Monitor

Exports

The export estimate for MY2025/26 is raised to 1.15 million MT, supported by higher crushing output and stable domestic consumption. This provides a larger supply for the export market, with stronger demand from, China and India, where MSPO-certified PKO is increasingly valued.

The export estimate for MY2024/25 remains unchanged, in line with data from the Malaysian Palm Oil Board (MPOB).

Stocks

Post forecasts for ending stocks in MY2025/26 remain unchanged, despite higher beginning stocks and increased production as the gains were offset by lower imports and raised exports and domestic consumption estimates.

For MY2024/25, the ending stock estimate is revised upward, as higher imports and production estimates outweigh the unchanged domestic consumption estimates.

Soybean – Oilseed

Production

Malaysia has no commercial cultivation of soybeans and production for all marketing years is forecast to remain at zero.

Consumption

The total domestic consumption estimate for MY2025/26 has been revised upwards to 723 thousand MT. The increase reflects higher crush and food use estimates by 20 thousand MT and 3 thousand MT, respectively, while feed waste is forecast to remain unchanged.

Based on the information from industry, currently most of the soybean mills are not performing at their full capacity, thus there is more space and sufficient capacity for the crush. The food use domestic consumption estimate is increased, reflecting the influence of population growth and evolving dietary preferences and raised import estimates. Traditional soy-based products such as tofu, tempeh, soy milk, and soy sauce remain staple while modern plant-based foods continue to gain popularity among urban households and health-conscious consumers.

For MY2024/25, the total domestic consumption estimate has been revised upward to 721 thousand MT due to higher imports. The African Swine Fever (ASF) outbreaks in Selangor have infected around 76,000 pigs with about [14,000 culled to contain disease](#)⁵, while in Penang, more than [2,000 pigs were culled](#).⁶

Trade

Imports

Post's import forecast for soybeans in MY2025/26 is raised to 715 thousand MT from the previous projection, reflecting strong demand for animal feed, particularly in the poultry sector, which depends on soy as a cost-effective protein source. Soybean imports to Malaysia are highly price sensitive, with

⁵ 14,000 pigs culled, DVS Selangor

⁶ African Swine Fever Hits Fifth Pig Farm In Tasek Gelugor

buyers adjusting volumes based on global market movements. U.S. soybean prices remain competitive with Brazil and Argentina, and depending on the harvest cycle, are at times at a discount. According to the latest WASDE report dated September 12, U.S. soybean export prices reduced to \$380/ton in mid-August due to the crop cycle and slowed demand from China.

Graph 6: Soybean Export Prices

Source: Oilseeds: World Markets and Trade – September 2025 USDA

For MY2024/25, imports are revised upward from 710 thousand MT to 745 thousand MT to align with official data based on consistent trade performance volume since January and across three consecutive marketing years. This increase is partly attributed to the competitive pricing of U.S. soybeans, a favorite for millers of premium full fat soybean and feed.

Graph 7: Import of Soybean for Three Consecutive Marketing Years 2022/23 until 2024/25

Source: Trade Data Monitor

Exports

For MY2025/26, the estimated soybean exports are revised upward from 8 thousand to 10 thousand MT. The adjustment reflects stronger regional demand, particularly from neighboring Southeast Asian countries where Malaysia benefits from larger ports and lower freight costs. The soybean export estimate for MY2024/25 is unchanged to align with the official data.

Stocks

The projection for stocks for MY2025/26 increased to 81 thousand MT. The higher beginning stocks and stronger imports are expected to offset only a marginal increase in domestic consumption.

The stocks estimate for MY2024/25 has been revised upward to 99 thousand MT, as the pace of imports has outpaced consumption growth and prices are favorable.

Table 5. Production, Supply, and Distribution for Soybean, 2023/24-2025/26

Oilseed, Soybean Market Year Begins	2023/2024		2024/2025		2025/2026

Soybean - Meal

Production

Post's production forecast for soybean meal in MY2025/26 is raised to 400 thousand MT, reflecting higher crush estimates.

For MY2024/25, production is also revised upward to 400 thousand MT, supported by stronger crush activity and higher soybean imports. Local crushing, however, contributes a limited share of total soybean meal supply. Current industry estimates place mills operating at 60 percent of their full crushing capacity.

Consumption

The total domestic consumption estimate for soybean meal in MY2025/26 is forecast to decline to 1.65 million MT from 1.66 million MT from the previous estimate. Meanwhile, in MY2024/25 total domestic consumption is estimated to remain unchanged due to lower demand from the poultry and swine sectors.

Soybean meals are one of the most important protein sources for compound feed, with demand driven largely by the poultry sector, including both broilers and layer hens. Recent disruptions in the supply of day-old chicks (DOC) due to avian influenza outbreaks in regional suppliers temporarily have slowed broiler placements. Countries like New Zealand, France, Brazil, and Spain are the largest suppliers of DOC as of late, with supplies from the United States halted since 2022 due to H5N1 concerns. New Zealand has active import-recognition status and is currently supplying DOCs to Malaysia, after a brief pause in early 2025 due to an isolated case of avian influenza. However, increased prices of DOC and the loss of the second-largest source of DOC to the Malaysian market since May (Brazil) are forecast to hamper chances of increasing flock size. Together with expectations that ASF will persist in Malaysia in the next marketing year, these factors are expected to limit feed demand and keep soybean meal consumption flat.

Trade

Imports

For MY2025/26, soybean meal imports are forecast to decline to 1.32 million MT. The combination of high-beginning stocks and increased local production from crushing offsets import needs.

In MY2024/25, the soybean meal import estimate is revised upward to 1.41 million MT to align with official figures, reflecting a sustained increase in shipments from Argentina between January and July 2025. This surge in purchases was encouraged by the decline in soybean meal export prices through most of MY2024/25, which improved import margins for Malaysian feed millers. According to Oilseeds, World Market and Trade, the price of soybean meal from Argentina was around \$340 per ton in October 2024 and showed a downward trend reaching \$290 per ton by July 2025, before rising again to \$300 per ton. The U.S. soybean meal has generally traded at a premium over Brazil and Argentine supplies, adding to feed costs for Malaysian millers. The persistent price gap, often \$20 to \$30 per ton higher, has reduced the competitiveness of U.S product in price sensitive feed markets such as Malaysia. Most of the soybean meal exported to Malaysia comes from Argentina.

Exports

Exports of soybean meal in MY2025/26 are forecast to remain unchanged. However, for MY2024/25, exports are revised upward by 5 thousand MT to reflect official data showing higher than expected export volumes, particularly in the six-month period beginning February 2025.

Stocks

The estimate for ending stocks for soybean meal in MY2025/26 is raised to 1.65 million MT, as higher supplies outpace reduced consumption.

For MY2024/25, the ending stocks estimate is raised to 1.7 million MT. Higher production, crush, and imports outpaced the increase in exports and unchanged total domestic consumption leading to an increase in ending stocks.

Soybean – Oil

Production

Post's production estimate for soybean oil in MY2025/26 is forecast to increase over previous estimates to 91 thousand MT, supported by higher crush volume resulting from increased soybean import estimates.

For MY2024/25, the production estimate is also revised upward by 2 thousand MT to 91 thousand MT, driven by stronger crush activity and higher soybean imports. Malaysia produces only small volumes of soybean oil through the crushing of imported soybeans.

Consumption

Post forecasts the total domestic consumption estimate for MY2025/26 to remain unchanged from previous estimate.

Post, however, revised the domestic consumption estimate for MY2024/25 down by 6 thousand MT to 73 thousand MT compared to the previous estimate. The decline is from lower import estimates. Although Argentine soy oil was cheaper than rapeseed and sunflower oil, it is less used than the domestically produced and subsidized palm oil, which dominates the Malaysian market for food use.

Trade

Imports

Import estimates for soybean oil in MY2025/26 remain unchanged. Post, however, revised the soybean oil import estimate for MY2024/25 downward to 82 thousand MT reflecting a slower pace of arrivals in the recent months compared to the previous year and to align with official data. Imports make up the bulk of soybean oil supply, with China and Argentina serving as the primary suppliers in MY2024/25.

Exports

The export estimate for soybean oil in MY2025/26 is forecast to remain unchanged. For MY2024/25, the export estimate is revised downward by 2 thousand making a new estimate of 108 thousand MT to reflect trends and volume reported by official data.

Stocks

Post's ending stocks estimate for soybean oil in MY2025/26 is forecast to increase over previous estimates from higher beginning stocks estimate.

Soybean oil ending stocks estimate for MY2024/25 remain unchanged.
