

Required Report: Required - Public Distribution

Date: December 08, 2025

Report Number: PK2025-0017

Report Name: Oilseeds and Products Update

Country: Pakistan

Post: Islamabad

Report Category: Oilseeds and Products

Prepared By: Waqas Farooq

Approved By: Mark Dries

Report Highlights:

In November 2025, the National Biosafety Committee (NBC) authorized imports of genetically engineered (GE) canola for food, feed, and processing. GE soybean import licenses have also been renewed by Pakistan's Environmental Protection Agency (EPA) for another year. Supported by this recent development, soybean imports are expected to further rebound to 2.4 million tons during 2025/26.

Oilseeds:

No major revisions have been made to the oilseed production, supply, and distribution estimates. Rapeseed production for 2025/26 is projected at 565,000 tons, reflecting a 10 percent increase over 2024/25. This anticipated growth in production is due to an expected expansion in planted area, as some farmers are shifting acreage from wheat to rapeseed. Since rapeseed sowing occurs in October–November, overlapping with the wheat planting time, this substitution is possible. Although the government recently announced a wheat support price ahead of 2025/26 planting, which is expected to discourage a major substitution shift, planting rapeseed will be preferred by some farmers with less productive land parcels, reflecting its lower input cost/risk profile in those areas.

Soybean production remains unchanged, as the crop's area expansion is still very limited. The Punjab government has announced the establishment of a Centre for Soybean Promotion in Faisalabad to support farmer adoption and promote soybean crops. Despite this initiative, domestic production remains very limited and highly fragmented, with most cultivation still at the demonstration stage. Large-scale commercial planting has yet to materialize, and the sector remains far from achieving a scale that could meaningfully reduce Pakistan's heavy reliance on soybean imports in the foreseeable future.

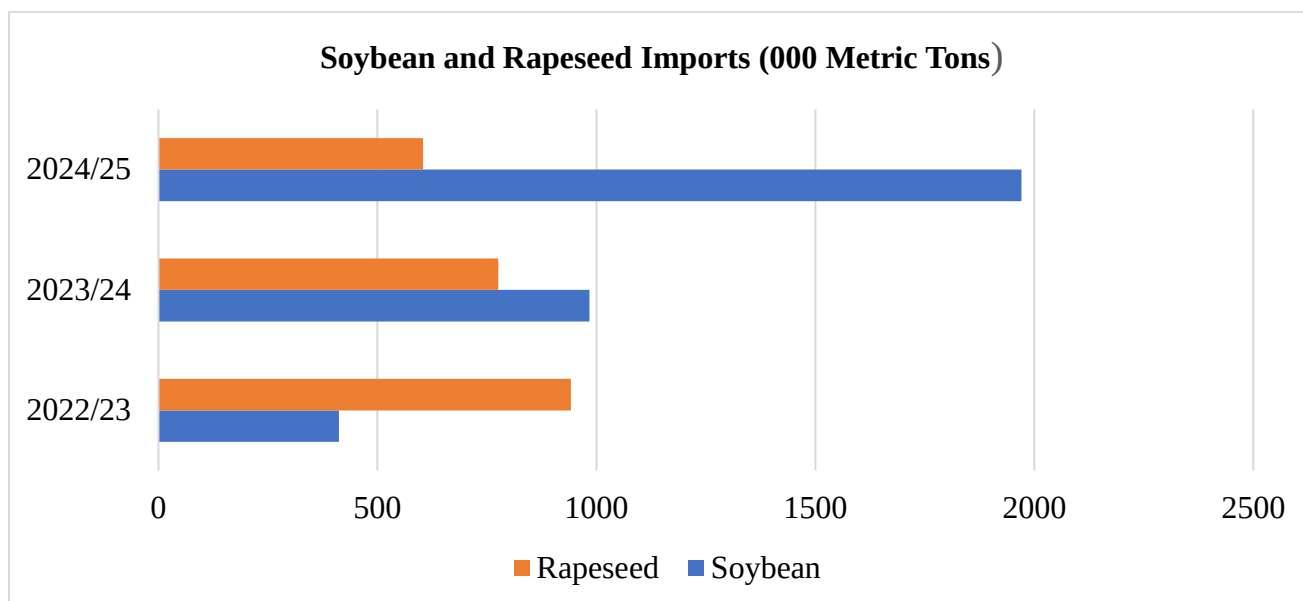

Trade

The National Biosafety Committee (NBC) of EPA extended all soybean import licenses for another year, now valid through November 2026. Pakistan continues to rely entirely on imported soybeans to meet domestic feed demand, and despite government initiatives, no significant increase in local soybean production is expected in the foreseeable future to support the feed industry. For 2025/26, soybean imports are forecast at 2.4 million tons, based on an estimated monthly consumption of 200,000 tons by the feed sector. The poultry industry which was impacted during the last three years due to the soybean shortage is also expected to grow in 2025/26, supported by a return to stable imported soybean supplies. Many poultry producers who had previously suspended operations due to inconsistent soybean availability have now resumed their businesses.

The rapeseed import forecast has increased slightly to 0.65 million tons for 2025/26. This increase reflects a recent regulatory decision granting market access for genetically engineered (GE) canola. Over the past three years, Australia gained the primary market share in Pakistan's rapeseed imports and accounted for 99 percent of that trade in 2024/25, totaling 0.6 million tons.

In 2025/26, GE rapeseed/canola imports are expected to resume, offering buyers a more cost-effective option and likely reshaping the market share distribution heavily in favor of Canadian-sourced canola.

Meals:

Pakistan's soybean meal production for 2025/26 is forecasted at 1.85 million tons, a 31 percent increase over 2024/25. This projected uptick in meal production is due to stable soybean availability and expected strong demand from feed mills during 2025/26. Over the past two years, due to tight soybean supplies, the industry imported soybean meals to fulfill their needs. With the availability of soybean imports for crushing now fully restored, no soybean meal imports are anticipated for 2025/26.

The stable supply of soybeans has already contributed to a decrease in poultry prices, and the industry remains optimistic that poultry production will rebound to levels prior to the GE soybean import stoppage. Consistent meal availability is also expected to encourage small poultry farmers who had closed their business operations due to high feed costs to resume business.

Rapeseed meal production is forecast to rise 10 percent in 2025/26 to 673,000 tons. This increase is due to an expected increase in domestic rapeseed/canola production and higher imports in the wake of resumed access for GE rapeseed, and since rapeseed/canola is primarily crushed to extract edible oil and meal used for dairy feed.
