## Roundup

Global markets look set for another comfortable season in 2017/18. World wheat production is forecast to fall below the 2016 record, but aided by large carryover stocks, wheat markets should remain adequately supplied. Given a record crop on the horizon, maize markets remain generally calm. A small increase in global production is expected to keep rice supplies ample, although reserves held by the major rice exporters may fall to a 10-year low. While early indications suggest a small drop in production of soybeans, large carryover stocks and ample export availabilities provide a buffer against the projected fall in production.

The **Market Monitor** is a product of the Agricultural Market Information System (AMIS). It covers international markets for wheat, maize, rice and soybeans, giving a synopsis of major market developments and the policy and other market drivers behind them. The analysis is a collective assessment of the market situation and outlook by the eleven international organizations and entities that form the AMIS Secretariat.

## World supply-demand outlook

- **Wheat** production forecast raised, largely on higher crop prospects in Canada, China and India, but still down sharply y/y.
- Utilization lowered mostly on revisions to China's historical feed use estimates, as well as the forecast for 2017/18.
- Trade in 2017/18 (July/June) raised slightly but still falling short of the 2016/17 record high volume.
- Stocks (ending in 2018) lifted sharply primarily due to significant upward revisions in China which more than offset downward adjustments in the US.

| Stocks      | 255.4   | 258.3   | 240.6   |

- **Maize** production prospects remain positive with bumper crops in southern hemisphere countries pushing up world output to a record level.
- Utilization lowered, largely reflecting adjustments to feed use forecasts of China and Indonesia, but still projected to increase by 1.9 percent y/y.
- Trade forecast for 2017/18 (July/June) down y/y but increased slightly m/m on higher import demand by several countries.
- Stocks (ending in 2018) now seen to decline less on y/y basis, largely because of upward revisions to inventories of Argentina, Brazil, Canada and China.

| Stocks      | 223.9   | 195.3   | 226.0   |

- **Rice** production forecast downgraded, on less buoyant prospects for Bangladesh and China, and a larger than anticipated reduction in Sri Lanka.
- Utilization forecasts trimmed, on lower expected feed and industrial uses. Still, overall use in 2017/18 seen up by 1.2 percent y/y, sustained by growing food needs.
- Trade in 2018 to expand modestly, as import gains in West Africa and the Near East are partly outweighed by cuts in the Far East.
- Stocks (ending in 2018) little changed m/m, as a downgrade for Bangladesh is largely compensated by various small upward revisions.

| Stocks      | 118.6   | 119.8   | 119.4   |

- **Soybean** 2016/17 production revised further upward on confirmation of record yields in Brazil and Argentina. Global 2017/18 production could slip 1.6 percent from the 2016/17 peak, assuming a return to trend yields in the US and South America.
- Global utilization projected to keep expanding, with most of the growth in 2017/18 driven by China, Brazil and the US.
- Trade in 2017/18 may rise further, stimulated by firm Asian import demand and ample export availabilities in the US and South America.
- Global stocks (2017/18 carry-out) could contract by almost 10 percent from the current season's all-time high.

Numbers shown refer to changes in forecasts (in thousand tonnes) since the previous report.

\* Soybean revisions refer to 2016/17 season.

## Crop monitor

### Crop conditions in AMIS countries (as of 28 May)

Crop condition map synthesizing information for all four AMIS crops as of 28 May. Crop conditions over the main growing areas for wheat, maize, rice, and soybean are based on a combination of national and regional crop analyst inputs along with earth observation data. **Only crops that are in other-than-favourable conditions are displayed on the map with their crop symbol.**

### Conditions at a glance

**Wheat** - In the northern hemisphere, wheat conditions remain mixed due to adverse weather that affected some primary growing regions within the US, Europe, China, Canada, and Ukraine, during a critical growing stage of the crops. In the southern hemisphere, wheat conditions are off to a mixed start in Australia, Argentina, and South Africa, though it is still early in the season.

**Maize** - In the northern hemisphere, sowing continues under overall favourable conditions except in Canada. In the southern hemisphere, the season is drawing to close. Harvest is ongoing with minor delays in Argentina. In Brazil, the second season is ending with a good expected crop. In South Africa a record crop is also anticipated.

**Rice** – Crop conditions in Asia are favourable across most of the region. In China and in the US there is some concern due to areas of heavy rainfall and flooding.

**Soybeans** - In the southern hemisphere, the season is drawing to a close with a good crop expected in Argentina despite some harvest delays and losses due to flooding. In the northern hemisphere, sowing is advancing under generally favourable conditions.

**Conditions:****Drivers:****Wheat**

In the northern hemisphere, the winter crop is mostly in late vegetative to reproductive stages (highly sensitive growth stages) and the spring crop is in planting to early vegetative stages. In the southern hemisphere, the crop is mostly in planting to vegetative stages. In the **EU**, dry and hot weather conditions hampered wheat growth and development in several regions, most notably in Spain and France, however overall expectations remain in-line with the average. In **China**, conditions are generally favourable for winter and spring wheat. However, there is some concern over central growing regions due to low temperatures. In the **US**, conditions are mostly favourable with the exception of the region around western Kansas (a primary growing region), where a significant winter storm occurred in late April. The extent to which the crop might have been damaged remains unclear and planted area is significantly down. In the **Russian Federation**, conditions are favourable for winter wheat development and spring wheat planting. In **Ukraine**, conditions are mixed as dry and cool conditions slowed crop development in central areas. In **Canada**, winter wheat is breaking dormancy with minimal winterkill except for in some minor production areas. Spring wheat planting is proceeding under generally favourable conditions with the exception of Alberta (a main productive region), where sowing is slowed due to excess moisture and field clearing. In **Australia**, dry conditions are present across most of the country as sowing is nearing completion.

**Maize**

Overall conditions in the northern hemisphere are favourable as sowing continues, while in the southern hemisphere harvest is ongoing. In the **US**, sowing is nearly complete and conditions are favourable at this early stage of the season. In **China**, conditions are favourable for both spring-planted and summer-planted crops, as sowing continues. In the **EU**, conditions are generally favourable with some areas in Eastern Europe under exceptional conditions. In **Ukraine**, sowing is complete with only localized areas of cold damage. In **Mexico**, conditions are favourable for both the spring-summer and autumn-winter crops. In **South Africa**, above-normal rain during much of summer together with a late onset of cold conditions during autumn is supporting an expectation for a record crop. In **Brazil**, conditions are favourable for the summer-planted maize as harvest begins. An increase in production compared to last year is expected due to an area increase. In **Argentina**, conditions are generally favourable though harvest is progressing slowly due to the prioritization of soybean harvest and to flooding in parts of the country.

**Conditions:****Drivers:****Rice**

Conditions are mostly favourable throughout the major growing regions. In **China**, conditions are generally favourable for early rice and single-season rice with the exception of southern china, where there is concern due to heavy rainfall affecting early rice. In **Indonesia**, good yields are expected as harvest of the wet-season progresses, while dry-season rice sowing is off to a slow start due to the extended wet-season. In **Viet Nam**, sowing of winter-spring rice in the north was completed under favourable conditions. In the south, conditions are favourable as harvest begins for winter-spring rice and sowing commences for summer-autumn rice. In **Thailand**, harvest of dry-season rice is almost complete, good yields and increases in planted area are expected to result in increased production. Wet-season rice is undergoing field preparations with an increase in planted area forecast owing to sufficient rainfall. In the **Philippines**, harvest of dry-season rice is complete with favourable yields, and sowing of wet-season rice began under favourable conditions. In the **US**, conditions are generally favourable with the exception of some areas along the Mississippi river where there has been unusual flooding.

**Soybeans**

In the northern hemisphere, there are no major concerns at this very early stage of the season. In the **US**, sowing is well underway and conditions are favourable throughout and in **China**, sowing is proceeding under favourable conditions. The southern hemisphere experienced an overall good season, which is now drawing to a close. **Argentina** is completing its harvest with some delays due to flooding. Production prospects remain positive owing to good yields, which are expected to offset the losses from flooding.

**Information on crop conditions in non-AMIS countries can be found in the [GEOGLAM Early Warning Crop Monitor](#), published 8 June 2017**

**Pie chart description:** Each slice represents a country's share of total AMIS production (5-year average), with the main producing countries (90 percent of production) shown individually and the remaining 10 percent grouped into the "Other AMIS Countries" category. Sections within each country are weighted by the sub-national production statistics (5-year average) of the respective country and accounts for multiple cropping seasons (i.e. spring and winter wheat).

*The late vegetative through to reproductive crop growth stages are generally the most sensitive periods for crop development.*

Sources and Disclaimers: The Crop Monitor assessment is conducted by GEOGLAM with inputs from the following partners (in alphabetical order): Argentina (Buenos Aires Grains Exchange, INTA), Asia Rice Countries (AFSIS, ASEAN+3 & Asia RICE), Australia (ABARES & CSIRO), Brazil (CONAB & INPE), Canada (AAFC), China (CAS), EU (EC JRC MARS), Indonesia (LAPAN & MOA), International (CIMMYT, FAO, IFPRI & IRR), Japan (JAXA), Mexico (SIAP), Russian Federation (IKI), South Africa (ARC & GeoTerraImage & SANSA), Thailand (GISTDA & OAE), Ukraine (NASU-NSAU & UHMC), USA (NASA, UMD, USGS – FEWS NET, USDA (FAS, NASS)), Viet Nam (VAST & VIMHE-MARD). The findings and conclusions in this joint multiagency report are consensual statements from the GEOGLAM experts, and do not necessarily reflect those of the individual agencies represented by these experts.

More detailed information on the GEOGLAM crop assessments is available at [www.geoglam-crop-monitor.org](http://www.geoglam-crop-monitor.org)

## Policy developments

### Wheat

- On 21 May, the Ministry of Supply in **Egypt** announced it will grant wheat farmers EGP 15 (USD 0.83) per tonne for wheat in jute bags, and EGP 10 (USD 0.55) per tonne of wheat to encourage storage in silos that are far from production areas and with significant remaining storage capacity.
- On 18 May, the General Authority for Supply Commodities in **Egypt** announced that the required level of protein will be raised by 0.5 percentage points in all wheat imports.
- On 10 May, **Italy** sought authorization from the European Commission to introduce country-of-origin labelling requirements on pasta sold within the European Union. Specifically, labels should clearly indicate where the grain was grown and milled.
- On 8 May, **Turkey** resumed wheat imports from the Russian Federation after an interruption since mid-March 2017. Private traders are reporting that the volume of authorized imports is now limited to 20-25 percent of the amount specified in import licences.
- On 5 May, the **Russian Federation** published new prices for 2017 intervention purchases. Approved for the first time, prices for wheat Class 1 and 2 were set at RUB 12 500 (USD 216) and RUB 11 500 (USD 199) per tonne, respectively.

### Maize

- On 11 May, the National Supply Company in **Brazil** held an auction of maize option contracts. Some 7 400 put option contracts, totalling 199 800 tonnes, were offered at a price of BRL 1.10 per bag of 60 kg (USD 5.7 per tonne). PEP and Pepro contracts were also auctioned with 300 000 tonnes and 500 000 tonnes offered, respectively. PEP and Pepro guarantee a minimum producer price of BRL 16.50 per bag of 60 kg (USD 84.2 per tonne).
- On 11 May, the government of **Turkey** authorized the Turkish Grain Board to import 500 000 tonnes of maize duty-free until 31 December 2017. Import licences under this tariff quota are issued by the Ministry of Economy and remain valid until the end of 2017.

### Rice

- On 2 May, Peru's National Organization for Phytosanitary Protection introduced new certification requirements for rice originating in **Brazil**, consisting of procedures applying in both Peru and Brazil. Peruvian importers must obtain a Phytosanitary Import Permit from the National Agrarian Sanitary Service before Brazilian rice is shipped. Brazil must also issue an official phytosanitary certificate confirming that rice exports are free from pests and have been fumigated with phosphine.
- The Ministry of Agriculture in **India** has proposed to increase the minimum support price for paddy rice from INR 1 470 per quintal (USD 219 per tonne) in 2016-17 to INR 1 550 per quintal (USD 241 per tonne) in 2017-18 for common grade rice, and from INR 1 510 per quintal (USD 225 per tonne) to INR 1 590 per quintal (USD 247 per tonne) for Grade 'A' rice.
- On 15 May, the Ministry of Commerce in **Thailand** announced the opening of an auction for 1.82 million tonnes of food-grade rice from state reserves. The public auction took place on 24 May and included white, jasmine, glutinous and fully broken rice.
- On 23 May, **Viet Nam** concluded an extension of the Memorandum of Understanding on rice trade that will allow Vietnam to supply up to 1 million tonnes of rice to Bangladesh each year.

### Soybeans

- Following the introduction on 1 March of subsidies for soybean production in disadvantaged regions, on 4 May the Ministry of Agriculture in **Argentina** set the reference price used to calculate related payments at ARS 5 367.57 (USD 346.3). This initial price will be subject to monthly reviews.
- On 19 May, Heilongjiang and Liaoning Provinces in **China** published respective policy documents confirming that soybean farmers will benefit from higher subsidies compared to maize farmers. This is in line with the policy outlined in China's 13<sup>th</sup> Five-Year Plan to increase soybean acreage at the expense of maize. Details on subsidy levels will be released at a later stage.

#### AMIS Policy database

Visit the **AMIS Policy database** at: <http://statistics.amis-outlook.org/policy/>

The **AMIS Policy database** gathers information on trade measures and domestic measures related to the four AMIS crops (wheat, maize, rice, and soybeans) as well as biofuels. The design of this database allows comparisons across countries, across commodities and across policies for selected periods of time.

## Across the board

---

- On 9 May, the government of **Australia** announced an AUS 20 billion (USD 15.4 billion) investment in the national railway infrastructure. At least AUS 8.4 billion (USD 6.5 billion) will be allocated to developing a high productivity rail freight corridor which aims to facilitate trade.
- **Australia** became the first WTO Member with export subsidy entitlements to follow through on the 2015 Nairobi Ministerial Decision on Export Competition to eliminate farm export subsidies. Its modified schedule is effective as of 22 May. Among the 16 Members with scheduled export subsidy reduction commitments, other G20 countries such as Brazil and the European Union have also informed the WTO that they have initiated internal procedures to modify their respective schedules.
- On 17 May, **Canada** amended the Transport Modernization Act (Bill C-49) to maintain the current revenue cap, known as the maximum revenue entitlement, on western grain. The revenue cap was introduced in 2000 to balance the market power of rail companies and ensure that farmers are not put at a disadvantage in terms of controlling the cost of grain movement.
- On 3 May, the Ministry of Finance in **China** issued a public notice (Cai Shui [2017] No. 37) announcing the reduction of the value-added tax (VAT) on agricultural goods, starting from 1 July 2017. In particular, the VAT faced by companies to import or sell agricultural goods will be reduced from 13 to 11 percent. Many products are covered by the new policy, including agricultural products and machinery, feed, pesticides, and chemical fertilizers.
- The International Trade Committee of the **European** Parliament has endorsed the European Commission proposals to increase duty-free tariff quota access for several Ukrainian agricultural products beyond the terms agreed under the existing preferential EU import arrangements. These additional market access opportunities include 650 000 tonnes of maize and 100 000 tonnes of wheat.
- On 4 and 5 May, the **EU** notified the WTO of the establishment of maximum residue levels for six

different kinds of pesticides in cereals. The regulation enters into force on 3 November 2017.

- On 11 May, the government of **Kazakhstan** was awarded a USD 180 million financing package by the European Bank for Reconstruction and Development to upgrade and develop the national irrigation system.
- On 18 May, the **US** Trade Representative formally initiated the renegotiation process of the North American Free Trade Agreement. Negotiations are set to begin no later than 16 August 2017.

## Biofuels

---

- On 4 April, the **EU** Parliament requested the European Commission to phase out the use of vegetable oil for production of biofuels because of environmental concerns.
- On 2 May, the government of **Argentina** published Resolution No. 117, which creates a working group consisting of representatives of private and public entities that are active in the production of biodiesel for self-consumption. The aim of the working group is to provide a platform for dialogue and consultation with regards to designing sustainable policies within the biofuel sector.
- Following a surge of maize-based ethanol imports from the US, the government of **Brazil** announced on 15 May that it will strengthen import requirements to protect domestic producers of sugarcane-based ethanol. The requirement to maintain minimum stock levels and the obligation to prove ability to meet market demand now apply equally to domestic ethanol producers as well as to importers. The Brazilian Chamber of Foreign Trade will determine whether to impose tariffs on maize-based ethanol imports from the US after the actual proceedings start in June 2017.
- In the **US**, a clean energy tax reform package was introduced on 4 May. The proposal comprises a technology-neutral tax credit intended to encourage the development and production of advanced and cellulosic biofuels, stimulating investment across a wider range of technologies, and promoting the growth of second generation biofuels.

## International prices

### International Grains Council (IGC) Grains and Oilseeds Index (GOI) and GOI sub-Indices

|                 | May 2017<br>Average* | M/M    | % Change<br>Y/Y |
|-----------------|----------------------|--------|-----------------|
| <b>GOI</b>      | 186                  | + 2.1% | - 6.7%          |
| <b>Wheat</b>    | 161                  | + 1.9% | - 2.1%          |
| <b>Maize</b>    | 172                  | - 0.3% | - 10.1%         |
| <b>Rice</b>     | 161                  | +5.1%  | + 1.3%          |
| <b>Soybeans</b> | 184                  | +2.1%  | - 10.2%         |

\*Jan 2000=100, derived from daily export quotations

#### Wheat

While generally remaining lower than a year ago, export values mostly edged higher during May, with day-to-day activity mainly linked to weather developments. Market participants closely monitored less than ideal conditions for 2017 crops in some areas, including in the US, Canada, the EU and Black Sea region. There was a noticeably firmer tone for higher protein grades as the early stages of the HRW harvest in the US showed below average yields and quality. In addition, the condition of the US spring wheat crop at the end of May was assessed to be the worst for several years and seeding delays persisted in Canada.

#### Maize

Average maize export quotations weakened during May, the IGC GOI sub-Index dropping to a 14-month low on comfortable availabilities and prospects for stiff competition on the world market. Spot prices in Argentina were lightly pressured by currency movements and as new crop supplies began to enter the export pipeline. Reflecting expectations for a large surplus, deferred quotations were especially competitive. FOB values in the US (Gulf) were slightly firmer, underpinned by concerns about cool, wet Midwest weather and talk of the need for substantial replanting in a number of southern and eastern states, where some intended maize area might be switched to soybeans.

#### Rice

Asian markets for white and parboiled rice grades strengthened during May, with sentiment buoyed by firmer international demand. In addition to shipments to Near East Asia and parts of Africa ahead of Ramadan, underpinning came from expectations of near-term buying interest from the Philippines, where National Food Authority stocks were at close to three-year lows, and from Bangladesh. In the latter country, news of a long-term agreement with Viet Nam surrounding future imports was particularly supportive. With gains steepest in Thailand and Viet Nam, the IGC GOI rice sub-Index rose by around 5 percent m/m.

#### Soybeans

Average global soybean export values were firmer during May, the IGC GOI sub-Index posting a net gain of around 2 percent, albeit still some 10 percent lower y/y. Markets were initially underpinned by solid export demand, including for old crop US supplies, and reluctant farmer selling in South America, where domestic values remained depressed. However, m/m increases in FOB quotations were limited by heavy global availabilities and an uptick in grower sales in Brazil following a depreciation of the local currency. More recently, talk that a small portion of intended US maize acreage could be switched to soybeans, coupled with news that some Chinese processors were seeking to delay or cancel purchases, mildly pressured.

Source: CME

### Futures prices

Prices for maize and soybeans changed little m/m although soybeans moved in a downward direction near month end. Soaking rains and reports of producers switching from maize to soybeans in the Upper Midwest helped push soybeans to a 13th month low. Wheat prices rose sharply at the start of the month, triggered by an unseasonable snow storm in the winter wheat growing region, and averaged 2.3 percent higher m/m. Despite the USDA projection of the lowest planted US wheat acres in a century, and sharply lower production for 2017/18, wheat prices remained in the low end of their 10 year range. Wheat and maize prices were around 8 and 6 percent lower y/y while soybean prices, which had traded higher y/y for ten of the past twelve months, were lower by 9.9 percent. Rice prices were up 5.2 percent m/m based on reduced acreage and flooding in rice growing areas, but lower y/y by 8.7 percent.

### Volumes and volatility

Wheat, maize and soybean volumes dropped by over 32 percent m/m. Volumes y/y for maize and soybeans were 17 and 44 percent lower respectively while wheat volume was 6 percent higher. Historical volatility increased somewhat for all three commodities as did implied volatility except in the case of soybeans which registered a slight decline.

### Basis levels and transport

Basis levels for wheat, maize and soybeans were mixed in the interior, while producers were mostly occupied with planting. In Illinois, the interior bids to local elevators firmed again m/m and were quoted at minus USD 9 and minus USD 11 per tonne under the July futures prices for maize and soybeans respectively. In Iowa the bids for maize slipped slightly to minus USD 17 and bids for soybeans firmed modestly to minus USD 26 (both under the respective July futures). Domestic soft red wheat values remained cheap relative to July futures prices as harvest was commencing. Gulf export quotations also were softer for maize at around USD 13 for maize, higher for soybeans at around USD 13 and unchanged for soft red wheat at around USD 17 – calculated on a per tonne basis over the respective July futures. Export clearances for wheat, maize and soybeans continued on their record

### Historical Volatility – 30 Days, nearby

|                 | Monthly Averages |        |        |
|-----------------|------------------|--------|--------|
|                 | May-17           | Apr-17 | May-16 |
| <b>Wheat</b>    | 26.3             | 23.5   | 33.3   |
| <b>Maize</b>    | 20.2             | 16.8   | 28.8   |
| <b>Rice</b>     | 24.9             | 13.8   | 25.1   |
| <b>Soybeans</b> | 12.3             | 11.4   | 23.8   |

pace at 130 per cent higher than last year, but did not impact barge freight which was steady at USD 13 per tonne (Illinois River to Gulf quotation).

### Forward curves

Forward curves for wheat and maize remained in the same pattern of upward slopes (contango) m/m. The soybean curve, which once showed an inversion (backwardation) between the July 2017 and November 2017 contracts of USD 17, reverted to a carry market (contango) indicating an ample ending stocks number for the 2016/17 crop year, now estimated by the USDA at 11.8 million tonnes.

### Investment flows

Managed money remained in a bearish strategy for the month for wheat, maize and soybeans, although it trimmed its record net short position for the three commodities reached late April of over 400 000 contracts to about 346 000 contracts. The decline was primarily in wheat, as managed money reacted to the USDA reduction of both sown acres and yield for the 2017/18 US wheat crop. Swaps dealers – which manage passive investments for large clients such as pension funds - dominated the long side of the market for all three commodities while commercials maintained relatively modest net short positions in wheat and maize and a modest net long position in soybeans.

## Monthly US ethanol update

- Ethanol **margins** decreased in May and became negative.
- Ethanol **spot** and **nearby futures prices** decreased in May, as RBOB gasoline prices decreased. Ethanol **futures prices** averaged 8 cents lower than gasoline.
- Domestic maize prices** increased during the month, leaving the average maize price 1 percent higher in May. This raised production costs per gallon by 2 cents. Decreased ethanol and DDGs receipts, and higher feedstock prices, led margins lower.
- Prices of DDGs** were down 1 cent and remained at a significant discount to maize price.
- Ethanol production** increased in May, with an annual pace of 15.7 billion gallons.

Based on USDA data and private sources

\* Estimated using available weekly data to date.

### Chart and tables description

**Ammonia and Urea:** Overview of nitrogen-based fertilizer prices in the US Gulf, Western Europe and Black Sea. Prices are weekly prices averaged by month.

**Potash and Phosphate:** Overview of phosphate and potassium-based fertilizer prices in the US Gulf, Baltic and Vancouver. Prices are weekly prices averaged by month.

**Ammonia Average and Urea Average:** Monthly average prices from Ammonia's US Gulf NOLA, Middle East, Black Sea and Western Europe were averaged to obtain Ammonia Average prices; monthly average prices from Urea's US Gulf NOLA, US Gulf Prill, Middle East Prill, Black Sea Prill and Mediterranean were averaged to obtain Urea Average prices.

**Natural Gas:** Henry Hub Natural Gas Spot Price from ICE. Prices are intraday prices averaged by month. Natural gas is used as major input to produce nitrogen-based fertilizers. **DAP:** Diammonium Phosphate.

## Fertilizer outlook

- **Ammonia** prices in the US Gulf remained steady m/m despite a decline in urea prices.
- **Urea** prices for both the US and the Black Sea fell m/m due to higher production and exports from the US.
- **DAP** prices in both the Baltic and the US decreased m/m as global supplies remained large. While the demand in both South America and South Asia increased considerably and inventories in the US fell, high production from the Mediterranean is pushing prices down.
- **Potash** prices held steady m/m despite global oversupply.
- The price of **natural gas** increased considerably y/y following higher demand in the US on the back of an unusually warm 2016 winter.

## Explanatory Notes

The notions of **tightening** and **easing** used in the summary table of “**World Supply and Demand**” reflect judgmental views which take into account market fundamentals, inter-alia price developments and short-term trends in demand and supply, especially changes in stocks.

All totals (aggregates) are computed from unrounded data. World supply and demand estimates/forecasts in this report are based on the latest data published by FAO, IGC and USDA; for the former, they also take into account information received from AMIS countries (hence the notion “**FAO-AMIS**”). World estimates and forecasts may vary due to several reasons. Apart from different release dates, the three main sources may apply different methodologies to construct the elements of the balances. Specifically:

**Production:** For wheat, production data refer to the first year of the marketing season shown (e.g. the 2016 production is allocated to the 2016/17 marketing season). For maize and rice, FAO-AMIS production data refer to the season corresponding to the first year shown, as for wheat. However, in the case of rice, 2016 production also includes secondary crops gathered in 2017. By contrast, for rice and maize, USDA and IGC aggregate production of the northern hemisphere of the first year (e.g. 2016) with production of the southern hemisphere of the second year (2017 production) in the corresponding 2016/17 global marketing season. For soybeans, this latter method is used by all three sources.

**Supply:** Defined as production plus opening stocks. No major differences across sources.

**Utilization:** For wheat, maize and rice, utilization includes food, feed and other uses (“other uses” comprise seeds, industrial utilization and post-harvest losses). For soybeans, it comprises crush, food and other uses. No major differences across sources.

**Trade:** Data refer to exports. For wheat and maize, trade is reported on a July/June marketing year basis, except for the USDA maize trade estimates, which are reported on an October/September basis. FAO-AMIS and IGC wheat trade data includes wheat flour in wheat grain equivalent. USDA wheat trade data also includes wheat products. For rice, trade covers flows from January to December of the second year shown, and for soybeans from October to September. Trade between European Union member states is excluded.

**Stocks:** In general, stocks refer to the sum of carry-overs at the close of each country's national marketing year. In the case of maize and rice, in southern hemisphere countries the definition of the national marketing year is not the same across the three sources as it depends on the methodology chosen to allocate production. For Soybeans, the USDA world stock level is based on an aggregate of stock levels as of 31 August for all countries, coinciding with the end of the US marketing season. By contrast, the IGC and FAO-AMIS measure of world stocks is the sum of carry-overs at the close of each country's national marketing year.
