While uncertainties surrounding US maize production prospects continue to dominate headlines, attention is gradually shifting to the production outlook for soybeans in the US, where protracted rainfall has also significantly delayed plantings. However, unlike the maize situation, large US stocks and ample South American harvests continue to point to a well-supplied global soybean market in 2019/20. In the meantime, the continuation of trade disputes, notably between the US and China, is likely to remain among the major factors shaping markets.

The **Market Monitor** is a product of the Agricultural Market Information System (AMIS). It covers international markets for wheat, maize, rice and soybeans, giving a synopsis of major market developments and the policy and other market drivers behind them. The analysis is a collective assessment of the market situation and outlook by the ten international organizations and entities that form the AMIS Secretariat.

Feature article

What is the “new normal” for commodity prices?

Most commodity prices gained momentum in the first half of 2019, following last year’s declines. Among the most salient trends affecting commodity prices now are the evolution of the US shale oil industry, China’s role as a major consumer of industrial commodities, and international trade tensions.

The emergence of the US as a dominant player in the global oil market—its output is now on par with production in the Russian Federation and Saudi Arabia—is shaping the energy price outlook. US shale oil production has (and is likely to) offset most of the price effect of any production cuts by the Organization of the Petroleum Exporting Countries (OPEC). Still, oil markets have been notoriously volatile in response to supply disruptions from politically-stressed producers (Libya, Nigeria, and Venezuela), sanctions on Iran, and ongoing geopolitical tensions.

In the metal markets, China plays an important role in shaping prices, having gone from consuming 10 percent of the world’s metals to more than 50 percent in the last two decades. Risks in the metal markets thus mostly reflect China’s growth prospects and environmental policies related to containing pollution.

As for agricultural markets, despite some price increases recently, largely in response to unseasonal weather in North America, markets remain generally well-supplied. This is evidenced by stocks-to-use ratios, a measure of supply availability, hovering around multi-year highs for many food crops. Apart from weather-related risks, agricultural markets continue to be impacted by the ongoing trade spat between China and the US and the recent outbreak of African Swine Fever in East Asia.

Overall, however, commodity markets appear to be stabilizing following the end of the boom that began in the early 2000s. The new average price level for most commodities is expected to be slightly higher than the pre-boom stable level but much lower than the 2008 and 2011 peaks.

This “new normal” is shaped by several factors. The post-2000 price boom attracted investment across the entire commodity spectrum, spurring innovation and technological improvements that lowered production costs. On the consumption side, demand has remained relatively weak, especially in emerging markets and developing economies that were key drivers of the boom, as economic growth in many of these countries has slowed down.

Alternative energy vehicles and policies reducing the use of fossil fuels are seen to negatively influence demand for energy commodities, intensifying the long-term trend of less energy use per unit of GDP. Similarly, synthetic substitutes for metals could lower demand for those commodities. Finally, demand from China, a key player in most industrial commodities, is expected to moderate as the country adopts a more consumption-led growth model.

Over the medium term, a combination of ample supplies, slower demand growth, and efficiency gains is thus likely to put a cap on commodity prices.

World supply-demand outlook

World Balances, with and without China*

- **Wheat** production forecast for 2019 increased slightly, mostly due to upward revision in India more than offsetting a cut in Pakistan.
- Utilization in 2019/20 raised, now up 1.5 percent from 2018/19, supported by improved production prospects and higher use of wheat for animal feed in place of maize.
- Trade in 2019/20 (July/June) points to a rebound from the 2018/19 reduced level, underpinned by stronger import demand in Africa and Asia.
- Stocks (ending in 2020) reduced, largely reflecting lower expected inventories in China and the US more than offsetting the higher forecast for Australia.

	147.4	153.3	151.9	136.6	148.2	141.2	147.6

- **Maize** production forecast for 2019 lowered, with a cut in the forecast for China outweighing a notable increase in Argentina.
- Utilization in 2019/20 lowered on slower rise of feed and industrial use, especially in Brazil where more supplies are destined for exports.
- Trade in 2019/20 (July/June) expected to remain below the estimated record volume in 2018/19 on tighter export availabilities in the US and reduced import demand, especially in the EU.
- Stocks (ending in 2020) expected to fall well short of their opening levels despite upward revisions in the EU and the US.

- **Rice** production in 2019 lowered fractionally, as reduced expectations, mainly for the US, are partly compensated by improved prospects for Egypt and several other countries.
- Utilization in 2019/20 still expected to expand by 1.4 percent supported by greater food intake.
- Trade is contracting by 3.1 percent in 2019 before rebounding to an all-time high in 2020.
- Stocks (2019/20 carry-outs) trimmed, primarily reflecting lower expected inventories in the Philippines and the US.

- **Soybean** 2019/20 production forecast lowered, pointing to a modest y/y drop, with downward adjustments this month for the US and Argentina only partially offset by upward revisions for Brazil.
- Utilization in 2019/20 trimmed somewhat, but still expected to expand in 2019/20 after a stagnation in 2018/19; consumption prospects in China and Argentina reduced since last month.
- Trade forecast for 2019/20 lowered marginally on expectation of smaller purchases by China; but growth in world trade still projected to resume after the 2018/19 decline.
- Stocks (2019/20 carry-out) raised slightly, with upward corrections for China more than offsetting lower forecasts for Argentina and the US; while falling somewhat, global carry-out is seen remaining at historically high level in 2019/20.

Crop monitor

Crop conditions in AMIS countries (as of 28 June)

Synthesis Conditions

Crop condition map synthesizing information for all four AMIS crops as of 28 June. Crop conditions over the main growing areas for wheat, maize, rice, and soybean are based on a combination of national and regional crop analyst inputs along with earth observation data. **Only crops that are in other-than-favourable conditions are displayed on the map with their crop symbol.**

Conditions at a glance

Wheat - In the northern hemisphere, winter wheat is under generally favourable conditions with some dryness in southwest Europe and in part of the Russian Federation. Spring wheat is favourable in the Russian Federation while Canadian conditions remain dry. In the southern hemisphere, Australia is experiencing persistent dry conditions in the east.

Maize - In the southern hemisphere, harvest is continuing in Argentina and Brazil with a bumper production forecast. In the northern hemisphere, North America is suffering from cool-wet conditions delaying sowing and emergence, while conditions in Europe are mostly favourable.

Rice - In China, conditions are generally favourable for all three seasons. In southern Southeast Asia, sowing of wet-season rice has begun in the northern countries, while harvest of wet-season rice nears completion and sowing of dry-season rice begins in Indonesia.

Soybeans - In the southern hemisphere, an above-average harvest is near completion in Argentina. In the northern hemisphere, the US and Canada are suffering delays in sowing from a long-lasting wet spring, while Ukraine is experiencing some dryness.

El Niño advisory

Weak El Niño conditions are present and are forecast to continue through the Northern Hemisphere summer (58 percent chance for July to September) and with lower odds for fall and winter (51-55 percent chance). Associated with this event are increased chances of below normal July to September rainfall in the Maritime Continent, eastern Australia, Central America, the Caribbean, and northern South America.

The Indian Ocean Dipole is forecast to be positive during July to November. Such conditions tend to reduce the influence of El Niño on Indian summer monsoon rainfall, enhance rainfall in parts of East Africa, and suppress rainfall in southern and central Australia.

Conditions:**Drivers:**

Canada¹, Russian Federation², South Africa³

Wheat

In the **EU**, winter wheat conditions remain overall favourable. Recent rains were beneficial in western and northern Europe but came too late in parts of central Europe, while dry conditions persist in southwestern regions. In **Ukraine**, conditions remain favourable for winter wheat in the ripening stage. In the **Russian Federation**, winter wheat conditions are mixed due to dry conditions in the Central and Volga districts. Spring wheat sowing is wrapping up under generally favourable conditions. In **Kazakhstan**, sowing of spring wheat has finished under favourable conditions. In **China**, winter wheat harvest is wrapping up under generally favourable conditions and spring wheat is developing under favourable conditions. In the **US**, harvest is beginning for winter wheat under favourable conditions in the main producing areas, while spring wheat conditions are generally favourable. In **Canada**, dry and drought conditions in the prairies have resulted in very low soil moisture and delayed crop emergence, affecting both spring and winter wheat. In the east, winter wheat is suffering from excessive soil moisture. In **Australia**, conditions are mixed with generally favourable conditions in southern growing regions, but dry conditions persist across large areas of eastern Australia and parts of Western Australia. In **Argentina**, sowing of wheat continues under generally favourable conditions, albeit hampered in places by rainfall.

Maize

In **Brazil**, harvest is ongoing for the summer-planted crop (higher producing season) under exceptional conditions. A bumper crop is forecast due to an increase in total sown area and increased yields. In **Argentina**, harvest is continuing albeit with some slight delays due to heavy rainfall. Conditions are favourable to exceptional for both spring-planted and summer-planted crops with a record harvest forecast. In **Mexico**, harvest of the autumn-winter cycle crop is continuing under favourable conditions while sowing of the spring-summer crop is progressing under favourable conditions with a slight increase in total sown area. In **China**, conditions are mixed as the spring-planted crop in the northeast has experienced below average rainfall since sowing. In the **US**, much of the country remains under watch conditions due to the persistent wet spring, which significantly delayed sowing. Additionally, the delay in sowing combined with the long-lasting spring provide risks to final yields. In **Canada**, conditions remain mixed due to dry conditions in Manitoba along with excessive moisture and delayed planting in the main producing eastern provinces. In the **EU**, conditions remain generally favourable with exceptional conditions in the southeast due to abundant rainfall. In **Ukraine**, conditions are favourable in the central and western regions, while the eastern and southern regions are experiencing dry to drought conditions.

Pie chart description: Each slice represents a country's share of total AMIS production (5-year average), with the main producing countries (95 percent of production) shown individually and the remaining 5 percent grouped into the "Other AMIS Countries" category. Sections within each country are weighted by the sub-national production statistics (5-year average) of the respective country and accounts for multiple cropping seasons (i.e. spring and winter wheat).

The late vegetative through to reproductive crop growth stages are generally the most sensitive periods for crop development.

Conditions:**Drivers:****Rice**

In **China**, conditions are generally favourable as harvest of early-rice and sowing of late-rice are ongoing. However, rainy and cloudy weather has hampered flowering and grain-filling for early-rice in the south. Single-season rice is under favourable conditions. In **Indonesia**, harvest of wet-season rice is almost complete with yields forecast to be close to average. Sowing of dry-season rice continues under favourable conditions with ample irrigation water. In **Viet Nam**, conditions are favourable as harvest for winter-spring rice (dry-season rice) has begun in the north and is wrapping up in the south. Sowing of summer-autumn rice (wet-season rice) has also begun in the south under favourable conditions. In **Thailand**, wet-season rice sowing is continuing under favourable conditions, with an expected increase in sown area compared to last year. Recent rainfall has improved conditions in the northeast region. However, the rainfall was too late to help dry-season rice, which is wrapping up under poor conditions in the northeast. In the **Philippines**, wet-season rice is under favourable conditions in the early vegetative stage, with near normal rainfall easing previous dry conditions. In the **US**, conditions are favourable.

Soybeans

In **Argentina**, harvest of spring-planted and summer-planted crops is almost complete with favourable to exceptional conditions in the main producing region. Heavy rainfall and flooding in the northern region has resulted in some reduction in harvestable area, however remaining crops are under favourable conditions. In **China**, dry conditions in the northeast persist since sowing. In the **US**, conditions remain primarily under watch due to the long-lasting wet spring. In **Canada**, conditions remain mixed across the country due to delayed sowing and reduced crop development. Significant areas remain unsown in the main producing province of Ontario because of the excess soil moisture while areas in Manitoba have delayed emergence due to dry conditions. In **Ukraine**, conditions are favourable in the western and central regions with adequate soil moisture, while dry to drought conditions are developing in the southern and eastern regions.

Information on crop conditions in non-AMIS countries can be found in the [GEOGLAM Early Warning Crop Monitor](#), published 4 July 2019

Policy developments

Rice

- On 19 June, **Canada** notified the WTO of a proposal to establish new maximum residue limits for *inorganic arsenic* in polished (white) and husked (brown) rice of 0.2 and 0.35 ppm respectively. Comments on the proposed measure can be made until 27 August 2019 (G/SPS/N/CAN/1250).
- On 19 June, Cambodia and **China** signed an agreement to enhance storage capacity in Cambodia for exports of paddy and milled rice to China. Warehouses with 827 000 tonnes capacity and silos that can dry 13 000 tonnes per day will be built in 11 provinces.
- On 3 June, **Japan** notified the WTO of a proposal to establish pesticide residue limits of 0.01 ppm for *Cyclopyrimorate* in brown rice (G/SPS/N/JPN/643).

Biofuels

- On 17 June, as part of RenovaBio, the Ministry of Mines and Energy in **Brazil** allowed companies in the sugar and ethanol sectors to raise capital for investment through tax exemption.

Across the board

- On 13 June, the Ministry of Agriculture in **Argentina** granted ARS 87 million through the National Fund for the Mitigation of Agricultural Emergencies and Disasters to assist producers in the Chaco province who were affected by severe floods (Resolution N ° 33/19).
- On 18 June, the Ministry of Agriculture in **Brazil** launched *Plan Safra 2019/2020*. BRL 225 billion (USD 58.4 billion) will be invested in the agriculture sector, of which BRL 222 billion (USD 57.65 billion) will be allocated to rural credits; BRL 1 billion (USD 258.1 million) to insurance premiums; and BRL 1.85 billion (USD 477.6 million) to marketing.
- On 5 June 2019, the Ministry of Agriculture in **China** recommended a list of 25 pesticides for emergency use against armyworms until December 2020.
- On 30 June 2019, the **EU** and **Viet Nam** signed a Free Trade Agreement that will eliminate tariffs on 99 percent of goods traded, including agricultural products, and address non-tariff measures. Upon entry into force, the EU will eliminate 71 percent of duties on Vietnamese imports and Viet Nam will eliminate 65 percent of duties in return. The remaining duties will be phased out gradually over a period of up to 7 and 10 years, for the EU and Viet Nam respectively. In the case of rice, the EU will open 3 duty-free tariff quotas of 30 000 tonnes of milled rice; 20 000 tonnes of husked rice; and 30 000 tonnes of fragrant rice. Moreover, the tariff on broken rice will be halved, and then subject to progressive cuts over 5 years.

- As part of the 2019-20 Budget, the Ministry of Finance in **India** is set to announce the granting of interest-free short-term loans to farmers of up to INR 10 million (USD 144 930) for 1-5 years subject to prompt repayment of the principal. The government may also extend the *PM-Kisan Scheme* to provide direct income support of INR 6 000 (USD 86.96) to small and marginal family farms with combined land holdings or ownership of up to 2 hectares.
- On 6 June, the **US** approved the *H.R. 2157: Additional Supplemental Appropriations for Disaster Relief Act of 2019*, that allocates USD 3 billion to USDA to compensate farmers who were impacted by natural disasters throughout 2018 and 2019. The aid would also provide for emergency timber restoration, farmland repair and watershed recovery.
- On 11 June, the **US** issued an Executive Order directing relevant federal agencies including the USDA, APHIS and the EPA, to ease rules for approving genetically-modified crops and other agricultural biotechnology. The modified review process aims to eliminate delays, reduce developer costs, enable predictability and facilitate development of genetically-modified plants that do not pose a plant pest risk.
- On 20 June, the **US** Department of Agriculture's Risk Management Agency adjusted the haying and grazing date on prevented plant acres from 1 November to 1 September for 2019. The measure is directed to farmers who were unable to plant maize and soybeans this year due to widespread flooding across the US Midwest.
- On 28 June, the **EU** and Mercosur countries (Argentina, Brazil, Paraguay and Uruguay) concluded negotiations on a trade agreement that will progressively enhance market access for goods and services while promoting cooperation in customs issues, food safety, and sustainable trade.

Stop Press

- On 29 May, **Saudi Arabia** detained a shipment of basmati rice from **India** due to concerns of phosphine fumigation.

AMIS Policy database

Visit the AMIS Policy database at: <https://app.amis-outlook.org/#/policy-database>

The AMIS Policy database gathers information on trade measures and domestic measures related to the four AMIS crops (wheat, maize, rice, and soybeans) as well as biofuels. The design of this database allows comparisons across countries, across commodities and across policies for selected periods of time.

Only AMIS participants are marked in bold.

*Jan 2000=100, derived from daily export quotations

Wheat

Uncertainty about production outlooks in a number of countries contributed to a solid overall gain in world wheat export prices during June. Much of the focus continued to be on overly wet weather for crops in the US, but there was also support from worries about soil moisture levels in Canada and Australia, as well as heat and dryness in the EU and the Black Sea region. While gains were trimmed in the second part of the month amid improving weather in some areas and growing expectations for a record global crop, the IGC GOI wheat sub-Index still rose by nearly 5 percent m/m. Export supplies in the Black Sea region stayed very competitively priced for the first part of the 2019/20 (Jul/Jun) trade year, with Egypt's GASC filling its first two new crop tenders with wheat from the Russian Federation and the EU (Romania).

Maize

The IGC maize sub-Index spiked sharply higher in June, with export prices inflated by a tighter world supply profile. Mainly because of deepening concerns about weather-related yield and acreage losses, the US market was especially buoyant. Underpinning also stemmed from difficult inland waterway logistics, lifting average Gulf quotations as much as 13 percent m/m, to a fresh five-year peak. Monthly price gains at competing South American exporters were almost as strong. As well as spillover from the rally in the US, FOB values in Argentina and Brazil were supported by robust overseas demand and movements in currency markets.

Rice

Average world white rice and parboiled prices were broadly steady in June, with Indian values nominally unchanged amid steady sales to West Africa. In Thailand, a stronger Baht underpinned firmer offers although gains were pared by weak international demand. In contrast, fresh paddy arrivals from the Summer/Autumn crop weighed on Vietnamese quotes, while US offers were largely steady on reduced prospects for 2019/20 production and as mills processed last month's 120 000 tonnes sale to Iraq.

Soybeans

Reflecting sizeable gains at all major origins, average world prices advanced by 8 percent in June. Strength was tied to heightened worries about the impact of excessive rains on 2019/20 US crop prospects. With a surge in maize values adding support, this more than offset pressure from export demand, as hopes for a quick resolution to the ongoing trade dispute with China remained faint. Since 2018/19 (Sep/Aug) outstanding sales were unusually big, traders were mindful that a portion might be cancelled or switched to the next season. Export quotations in Brazil were buoyed by international demand and US market firmness, while a slowdown in farmer selling and currency movements recently underpinned. Despite a large harvest, Argentine prices moved higher on strong Chinese buying interest.

Futures Prices

Prices for wheat, maize, soybeans and rice extended their rallies m/m, as recurrent storm-fronts delayed large swaths of maize and soybean planting by record percentage points.

Maize prices hit a five-year high as regional planting windows closed, generating estimates between 5 and 8 million acres that could qualify for the USDA Prevented Planting insurance schemes or result in failed acres.

Soybean prices, which slumped to eleven year lows during mid-May as a result of the still unresolved trade war and the spread in East Asia of African Swine Fever, staged a recovery to April levels.

Wheat prices also rose in sympathy with maize and soybean values although planting progress for spring wheat in the northern region was near normal and winter wheat yields reported from the harvest in the southern plains were above expectations. Chicago-traded soft red wheat climbed to a record premium of USD 24 per tonne over the Kansas City-traded hard red wheat, upending its normal discount status. Analysts cited a pick-up in export demand for the soft red wheat variety while fierce competition from the Black Sea region weighed on hard red wheat prices.

From July forward, attention will focus on summer weather patterns and USDA assessments of crop conditions which so far reflect a below average start to maize and soybean crop emergence. In exogenous markets, the USD index slumped from its highs in May as did the price of West Texas Intermediate crude oil, to no seeming effect on agricultural prices. On average, prices rose m/m about 14 percent for wheat and maize, 7 percent for soybeans and 4.3 percent for rice. The y/y comparison was mixed: maize showed the largest percentage price gain of 19.3 percent followed by wheat at 4.8 percent while soybeans and rice registered y/y losses of 3.9 and 3.7 percent respectively.

On 28 June, the USDA released its acreage survey for wheat, maize, and soybeans (conducted during the first two weeks of June). It estimated maize acres

Historical Volatility – 30 Days, nearby

	Monthly Averages		
	June-19	May-19	June-18
Wheat	36.0	24.3	33.7
Maize	30.6	21.8	21.0
Rice	15.4	15.0	31.8
Soybeans	22.3	15.7	19.2

considerably higher (about 5.0 million acres) and soybean acres considerably lower (about 4.3 million acres) than the average trade estimates. The survey was based on both planted acres and intended acres and will be revised to reflect actual planted in August.

Volumes and volatility

Trade volumes rose for wheat and soybeans m/m and reached a record high for maize. With the exception of maize, volumes were lower y/y for wheat and soybeans. Implied volatility and historical volatility were higher for all three commodities both m/m and y/y with maize reaching multi-year highs for both measures.

Basis levels and transport

Domestic basis levels firmed m/m for maize and soybeans, as producers struggled with planting delays and potential crop shortfalls. In Illinois, while some maize processors were bidding plus USD 8 for spot delivery, average quotes to local elevators were minus USD 4 per tonne for maize, and minus USD 11 per tonne for soybeans, each under the respective July futures prices. In Iowa, maize and soybean bids rose slightly m/m to minus USD 10 and minus USD 28 respectively (under the respective July futures). In soft red wheat, bids for delivery to northern flour mills were considerably higher m/m at premium levels to July futures. Maize and soybeans delivered to Gulf were quoted as high as at USD 32 and USD 28, respectively, while wheat quotes ranged from USD 26 and USD 32, (per tonne premium over respective July futures).

The US Coast Guard opened the St. Louis harbor for navigation in late June after months of flooding on the Mid-Mississippi River. Barge freight for the Lower Illinois River was USD 26 per tonne, 45 percent higher than the three-year-average while barge shipments increasingly lagged behind at 64 percent of last year's tonnage. The USDA reported total exports for wheat, which ended its crop year 31 May, were 8 percent higher than last year. For maize and soybeans, which have crop years extending until 31 August, exports were 102 and 76 percent of last year respectively. High US maize prices relative to South American values prompted feeders on

For information on technical terms please view the Glossary at the following link:
http://www.amis-outlook.org/fileadmin/user_upload/amis/docs/Market_monitor/Glossary.pdf

the US Atlantic Coast to book ten cargoes or more of southern hemisphere maize for fall arrival.

Forward curves

Forward curves displayed much the same volatility as prices during June as traders grappled with crop projections, particularly for maize and soybeans. Although the price curves remained in contango (upward sloping) for the nearby months, they gyrated considerably for the harvest to end-year crop spreads. The December 2019 - December 2020 spread for maize – which flipped from contango to backwardation (downward sloping) in May further increased its downward slope m/m from USD 9 to as much as USD 18 per tonne. Both soybeans and wheat experienced a narrowing of one year spreads by several USD per tonne but unlike maize, remained in contango as their balance sheets remained fundamentally in surplus.

Investment flows

Managed money extended its buying strategy for all three commodities that it began in mid-May when persistent storm-fronts suddenly threatened production levels in the US growing regions. In maize, and to a lesser extent wheat, it covered its remaining net short positions to establish moderate net long positions. In soybeans it reduced its net short position by about 40 percent m/m. Commercial hedgers including producers, continued to sell into the higher price levels, establishing a large net short in maize and moderate net shorts in wheat and soybeans.

Monthly US ethanol update

- **Maize prices** in the US surged as large areas of the Corn Belt received record or near record levels of rainfall accumulation during the planting season. Maize prices rose, in absolute terms and relative to soybeans, as the market anticipated tight maize supplies in the new season.
- **Ethanol production** fell slightly m/m, but with one day less in the month, the production pace increased.
- **Ethanol prices** rose, counter to falling RBOB gasoline prices, following maize higher.
- **DDGs prices** moved up in tandem with maize, also reflecting tighter outlook for domestic feed markets.
- While ethanol and DDGs receipts increased sharply, the rapid rise in the cost of maize more than offset those gains resulting in returns to ethanol production remaining notably negative.

Spot prices	June	May	June

Ethanol production pace, capacity and annual mandate

Ethanol Production Margin (IA, NE, IL/eastern corn belt average)

Ethanol and RBOB gasoline (nearby futures prices, CME, NYSE)

Ethanol price vs. maize price (Spot prices)

Chart and tables description

Ethanol Production Margins: The ethanol margin gives an indication of the profitability of maize-based ethanol production in the United States. It uses current market prices for maize, Dried Distillers Grains (DDGs) and ethanol, with an additional USD 0.55 per gallon of production costs

Ethanol Production Pace, Capacity and Mandate: Overview of the volume of maize-based ethanol production in the United States; it also highlights overall production capacity and the production volume that is mandated by public legislation. Name-plate (i.e. nominal) ethanol production capacity in the US is roughly 14.9 billion gallons per annum, but plants can exceed this level, so the actual capacity is assumed to be 15.2 billion gallons.

DDGs: By-product of maize-based biofuel production, commonly used as feedstuff.

RBOB: Reformulated Blendstock for Oxygenate Blending, gasoline nearby futures (NYSE).

Fertilizer outlook

**Ammonia and Urea
(Spot prices)**

**Potash and Phosphate
(Spot prices)**

**Ammonia Average, Urea Average and Natural Gas
(Spot prices)**

- **Natural gas prices** continued falling since February due to rising inventories and cooler weather conditions in the Northern Hemisphere resulting in lower cooling needs.
- Despite higher demand from Turkey and China, **ammonia prices** continued to decrease due to oversupply, particularly in Europe.
- **Urea prices** slowly recovered, especially in the Middle East, as demand from India strengthened.
- Ample supplies in Brazil and China kept **DAP** prices below last year's levels.
- US **potash prices** remained low as record rainfall delayed plantings and prevented significant areas from being planted thus reducing fertilizer use.

Monthly ocean freight market update

Dry bulk freight market developments

	Jun 2019 Average	M/M	% Change	Y/Y
Baltic Dry Index (BDI) *	1155	+ 11.5%		- 14.5%
<i>sub-Indices:</i>				
Capesize	1954	+ 35.5%		- 4.4%
Panamax	1175	- 6.0%		- 14.5%
Supramax	774	- 4.9%		- 31.9%
Baltic Handysize Index (BHSI)**	422	+ 9.1%		- 28.2%

Source: Baltic Exchange.

Note: *4 January 1985 = 1000 **23 May 2006 = 1000. Baltic Handysize sub-Index excluded from the from 1 March 2018

- The dry bulk freight market maintained positive momentum in June, partly owing to firmer bunker prices, with the **Baltic Dry Index (BDI)** averaging 12 percent higher m/m. However, the overall Index masks underlying trends in the grains and oilseeds carrying segments, where declines in average Panamax and Supramax rates, amid limited fresh demand, were coupled with moderate gains for Handysize carriers, most notably in the Atlantic.
- **Capesize** quotations rose by more than one-third on resurgent iron ore activity in Brazil after months of disruption due to a mining dam collapse, with fresh business in the Black Sea region and eastern Canada adding to the upside.
- Despite a recent upturn on brisk activity out of Indonesia and limited tonnage supply in the Mediterranean, **Panamax** values slipped by 6 percent on average, led by losses on transatlantic routes.
- **Supramax** earnings also edged lower, the average for the Baltic sub-Index down by 5 percent m/m, as weakness in the earlier half of the month, partly linked to holidays in Asia, contrasted with strength in the Black Sea region, where average earnings increased by more than one-third. The Baltic Handysize Index climbed by 9 percent, chiefly on steady increases at the US Gulf amid inland logistical difficulties, as well as a touch more activity out of South America.

Baltic Dry Index (BDI): A global benchmark indicator issued daily by the London-based Baltic Exchange, providing an assessment of the costs of moving major raw materials on ocean going vessels. The BDI is a composite measure, comprising sub-indices for four carrying segments, representing different vessel sizes: Capesize, Panamax, Supramax and Handysize.

Capesize: The largest vessels included in the BDI with deadweight tonnage (DWT) above 80 000 DWT, primarily transporting coal, iron ore and other heavy raw materials on long-haul routes.

Panamax: Vessels with capacity of 60 000 to 80 000 DWT, which are mostly geared to transporting coal, grains, oilseeds and other bulks, including sugar and cement.

Supramax/Handysize: Vessels with capacity below 60 000 DWT, which account for the majority of the world's ocean going vessels. They can transport a wide variety of cargos, including grains and oilseeds.

Explanatory Notes

The notions of **tightening** and **easing** used in the summary table of “Markets at a glance” reflect judgmental views that take into account market fundamentals, inter-alia price developments and short-term trends in demand and supply, especially changes in stocks.

All totals (aggregates) are computed from unrounded data. World supply and demand estimates/forecasts are based on the latest data published by FAO, IGC and USDA. For the former, they also take into account information provided by AMIS focal points (hence the notion “FAO-AMIS”). World estimates and forecasts produced by the three sources may vary due to several reasons, such as varying release dates and different methodologies used in constructing commodity balances. Specifically:

Production: Wheat production data from all three sources refer to production occurring in the first year of the marketing season shown (e.g. crops harvested in 2016 are allocated to the 2016/17 marketing season). Maize and rice production data for FAO-AMIS refer to crops harvested during the first year of the marketing season (e.g. 2016 for the 2016/17 marketing season) in both the northern and southern hemisphere. Rice production data for FAO-AMIS also include northern hemisphere production from secondary crops harvested in the second year of the marketing season (e.g. 2017 for the 2016/17 marketing season). By contrast, rice and maize data for USDA and IGC encompass production in the northern hemisphere occurring during the first year of the season (e.g. 2016 for the 2016/17 marketing season), as well as crops harvested in the southern hemisphere during the second year of the season (e.g. 2017 for the 2016/17 marketing season). For soybeans, the latter approach is used by all three sources.

Supply: Defined as production plus opening stocks by all three sources.

Utilization: For all three sources, wheat, maize and rice utilization includes food, feed and other uses (namely, seeds, industrial uses and post-harvest losses). For soybeans, it comprises crush, food and other uses. However, for all AMIS commodities, the use categories may be grouped differently across sources and may also include residual values.

Trade: Data refer to exports. For wheat and maize, trade is reported on a July/June basis, except for USDA maize trade estimates, which are reported on an October/September basis. Wheat trade data from all three sources includes wheat flour in wheat grain equivalent, while the USDA also considers wheat products. For rice, trade covers shipments from January to December of the second year of the respective marketing season. For soybeans, trade is reported on an October/September basis by FAO-AMIS and the IGC, while USDA data are based on local marketing years except for Argentina and Brazil which are reported on an October/September basis. Trade between European Union member states is excluded.

Stocks: In general, world stocks of AMIS crops refer to the sum of carry-overs at the close of each country's national marketing year. For soybeans, stock levels reported by the USDA are based on local marketing years, except for Argentina and Brazil, which are adjusted to October/September. For maize and rice, global estimates may vary across sources because of differences in the allocation of production in southern hemisphere countries.
