Date: July 05, 2024

Report Number: CH2024-0077

Report Name: Oilseeds and Products Update

Country: China - People's Republic of

Post: Beijing

Report Category: Oilseeds and Products

Prepared By: FAS China Staff

Approved By: Adam Branson

Report Highlights:

Soybean production for MY 24/25 is forecast at 19.6 million metric tons (MMT) based on planted area of 9.95 million hectares (Mha). The relatively low and declining soybean meal (SBM) prices since the beginning of MY 23/24 could encourage more SBM use in feed production. Post raised its forecast for MY 24/25 rapeseed production to 15.8 MMT based on a slight gain in acreage to 7.4 Mha and higher yield. Post maintains its forecast of MY 24/25 peanut production at 18.1 MMT. Forecast MY 24/25 cottonseed production remains unchanged at 9.3 MMT based on a slight drop in production area offset by yield gain.

Production

Soybeans

Soybean production for MY 24/25 is forecast at 19.6 million metric tons (MMT) based on a planted area of 9.95 million hectares (Mha), unchanged from the [Oilseeds and Products Annual CH2024-0042](#). MY 24/25 production and planted area forecasts are both lower than Post's estimates for MY 23/24 on lower soybean price and profits received by Chinese farmers in MY 23/24.

Low soybean prices and farmer margins for both food use and beans for crushing in MY 23/24 was the primary factor for the moderate area decline in MY 24/25, despite the People's Republic of China (PRC) continued efforts to subsidize soybean planting. The June China Agriculture Supply and Demand Estimate (CASDE) report forecasts total soybean planted area will fall to 10.16 Mha, down 3 percent year-over-year and production will slide to 20.54 MMT from the 20.84 MMT the previous year (Table 1). However, the China Shanghai JC Intelligence Company (JCI), a leading industry source, forecasts a 2.4 percent area growth and a 1.45 percent growth in soybean production for MY 24/25.

Table 1. China: Forecast MY 24/25 Soybean Area/Production by Leading Sources

Mha/MMT	CASDE	JCI	FAS/China
MY23/24 area	10.47	10.3	10.05
MY24/25 area	10.16	10.5	9.95
MY24/25 y-o-y area change in %	-2.9	+2.4	-1
MY24/25 production	20.54	20.95	19.6
MY24/25 y-o-y production change in %	-1.4	+1.45	-0.5

Source: MARA; China Shanghai JC Intelligence Co., Ltd.

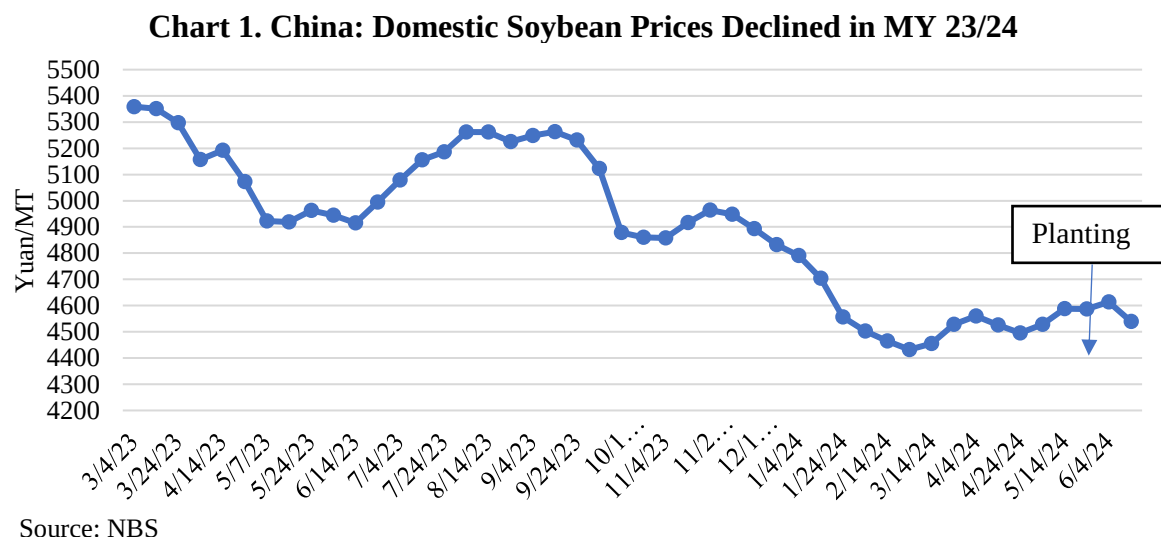

PRC central and local governments are expected to maintain soybean support policies in MY 24/25. In addition to the soybean subsidy in Heilongjiang (Table 2), Chinese media reported an additional subsidy for “large row and high-density planting” at 750 yuan/hectare (Ha) (\$106/Ha) together with a “rotation” subsidy of 2,250 yuan/Ha (\$317/Ha).

Table 2. China: Soybean and Corn Subsidy Rates and Planted Area for Heilongjiang

Crop	2022		2023		2024	
	Corn	Soybeans	Corn	Soybeans	Corn	Soybeans
Subsidy/Yuan/Ha	420	3,720	210*	5,490*	300*	Above 5,250**
Planted area (1,000 Ha)	5,970	4,932	6,452	4,887		

Source: NBS and 2023 Heilongjiang Social and Economic Development Communique; subsidy rates are estimated by industry source; * Chinese media estimate; **China's media cited Heilongjiang Agricultural Department

Soybean prices declined significantly from the onset of the MY 23/24 harvest according to the National Bureau of Statistics (NBS) (Chart 1). The average price for domestic soybeans from October 2023 to February 2024 was 4,806 yuan/metric ton (MT) (\$677/MT), 15 percent lower than the previous year.

The Heilongjiang Department of Agriculture and Rural Affairs reported that soil moisture, use of high-speed precision seeders, improvements in agricultural standardization, and strict implementation of those standards greatly improved the sowing process this year. Heilongjiang seeding was reportedly completed by the end of May 2024. Total planted area exceeded the government’s target by 788,000 Mu (52,500 Ha), while an earlier report by the Heilongjiang state farm group said its soybean area remained unchanged at 921,700 Ha from MY 23/24.

At a Ministry of Agriculture and Rural Affairs (MARA) meeting on May 9, 2024, in Heilongjiang, experts discussed chemical coated soybean planting and exchanged views on soybean seed coating, rhizobia agent inoculation, and large row dense planting. The participants discussed the increasing occurrence of soybean root rot in recent years and how preventing and controlling root rot is crucial to improving soybean yields in large areas. According to Heilongjiang Agriculture and Rural Affairs, 12 million Mu (0.8 Mha) of soybeans are planted with rhizobia agent inoculation technology and 20 million Mu (1.33 Mha) are planted using “large row dense planting” in MY 24/25. The agricultural extension agencies in the four Northeast Provinces (i.e., Heilongjiang, Inner Mongolia, Jilin, and Liaoning) will provide technical services, including planting, fertilizing, weeding, and harvesting, to soybean farmers to raise yield in MY 24/25.

Adequate rainfall and sunshine combined with moderate temperatures throughout most of the Northeast facilitated soybean sprouting in MY 24/25, based on China’s National Agricultural Meteorological Reports from April to May. By mid-June, there were no significant adverse weather events reported in major soybean-producing regions. However, extremely high temperatures reported in the first half of June in Hebei and Shandong may impact soybean, peanut, and cotton growth. In mid-June, PRC authorities allocated funds to these provinces to alleviate the impact of the drought and heat on crops.

Rapeseed

Post slightly raised its forecast for MY 24/25 rapeseed production from its previous report to 15.8 MMT, also up from the previous year’s 15.4 MMT based on a slight gain in acreage to 7.4 Mha and higher yield. NSB reported MY 23/24 rapeseed production at 16.3 MMT, up from 15.5 MMT in the previous year, while the China National Grain and Oils Information Center (CNGOIC) forecasts a higher production number for MY 24/25. China has two planting periods for rapeseed: the winter crop, planted

in November/December and harvested in summer (April/May), and the summer crop, planted in June and harvested in September. The winter crop accounts for more than 90 percent of production and is predominantly grown in Sichuan, Hubei, Hunan, Anhui, Guizhou, Jiangsu provinces. The summer crop contributes less than 10 percent to the country's total production and is primarily cultivated in Inner Mongolia, Gansu, Qinghai, and Xinjiang.

Farmers completed the rapeseed harvest in late May with estimated production slightly higher than the previous year. Based on official media reports, Sichuan, China's largest rapeseed producing province, saw a moderate increase in planted area to 1.45 Mha and yields improved in several regions of the province, leading to higher rapeseed production in MY 24/25. Industry sources report that rapeseed production in Hubei is stable or slightly up with a 5 percent increase of acreage offset by lower yields due to freeze during the early growing stage. China's Central Meteorological Center's model shows the rapeseed yield is up 1.5 percent year-over-year in Sichuan, Guizhou, Yunnan, and Jiangxi while down 1.5 percent in Anhui in MY 24/25. Industry sources report that rapeseed prices have slowly declined since harvest to about 6,150 yuan/MT (\$866/MT) in mid-June, down about 4 percent from early May and down 6.9 percent year-over-year. Increased imports of rapeseed meal and oil together with low priced imports of rapeseed at about \$570/MT has had an impact on local crop prices. There is little public information on the planting of MY 24/25 autumn-harvested rapeseed in western regions; however, the area is generally stable, and products are mainly aimed at local market consumption.

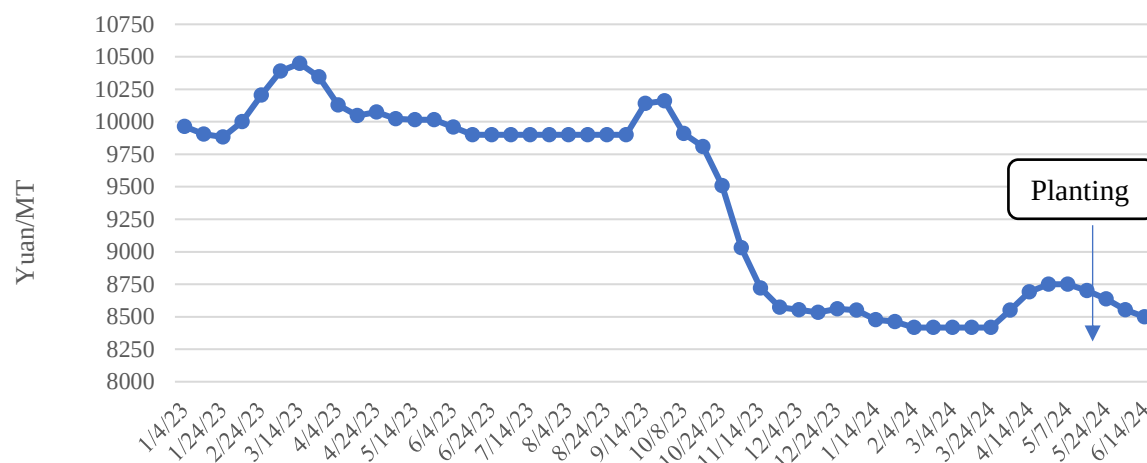

Contrary to official reports on rapeseed area and production, industry contacts continue to assess that China's actual rapeseed production may be as low as half of the PRC's official estimates based on crushing volumes and the utilization/operation rate of crushing plants in their respective regions. According to contacts, the PRC's subsidy policy and local governments' responsibility to fulfill the central government's production targets likely leads to an overestimate of rapeseed production.

Peanuts

Post maintains its forecast for MY 24/25 peanut production at 18.1 MMT, down from the estimated 18.3 MMT in MY 23/24. Peanut production area remains mostly stable due to comparatively strong margins with competing crops and a three-year average yield. NBS's peanut production for MY 23/24 is at 19.2 MMT from the 18.3 MMT in the previous year.

Peanut prices falling since harvest reduced peanut profits in MY 23/24; however, the price rebounded slightly in the planting months of 2024. Despite price fluctuations, peanut profits in recent years have exceeded those for cotton, corn, and soybeans in most peanut-producing regions. Based on Chinese industry data, peanut profits ranged from 10,500 to 16,500 yuan/Ha (\$1,480 to 2,320/Ha) in Henan in MY 23/24, while profits for corn were about 12,000 yuan/Ha (\$1,690/Ha). In Liaoning, peanut profits were 7,500 yuan/Ha (\$1,056/Ha), while corn profits were 6,000 yuan/Ha (\$845/Ha). The Henan Meteorological Bureau recommended farmers plant peanuts from June 5 to 14 as it forecast high temperature and less rainfall from May 24 to June 30. Industry source reported that most farmers had completed planting as of mid-June and growth in leading provinces has been normal. However, the impact of extreme heat in the second week of June in Hebei, Henan, and Anhui on peanut growth could still impact the peanut crop in those regions.

Chart 2. China: Peanut Price Remains Low in MY 24/25

Source: NBS

Cottonseed

Forecast MY 24/25 cottonseed production remains unchanged from the previous report at 9.3 MMT based on a slight drop in production area offset by yield gain. There were no major events during the MY 24/25 cotton planting nationwide. Farmers in Xinjiang completed planting on schedule, and, as of mid-June, there is normal cotton growth nationwide. Cottonseed production is not officially available, and estimates of production vary among industry sources (See analysis of cotton seed production in [Oilseed and Products Update CH2023-0102](#)). Post uses an industry source suggested ratio at 1.55 to 1.6 to calculate cotton seed production from cotton production.

China Cotton Association's (CCA) MY 24/25 planted area forecast is down 2.4 percent from the previous year, but CCA has not made a forecast for production. Another leading industry source forecasts a 3.5 percent year-over-year decline of planted area and a 3 percent fall in production to 5.83 MMT for MY 24/25 (with area and production for Xinjiang both down 2.2 percent and 1.9 percent, respectively, from the previous year). The official for Cotton Industry Coordination Leading Team of Xinjiang Uygur Autonomous Region Government expects MY 24/25 Xinjiang cotton production to be stable with a planted area around 35 million Mu (2.33 Mha). The June CASDE report echoed CCA on a smaller cotton acreage for MY 24/25 at 2.75 Mha, down from the 2.79 Mha the previous year, and forecast a one percent reduction in MY 24/25 cotton production year-over-year. Industry contacts agree that reduced cotton profits in MY 23/24 and Xinjiang's restructuring of the crop mix and phasing out cotton planting in low-quality and low-efficiency cotton fields will lead to a slight decline of acreage for MY 24/25. Additionally, technical advancement continues to boost cotton yields.

Sunflower Seed

NBS reported that sunflower seed production for MY 22/23 was 1.74 MMT on smaller planted area. Both the planted area and production are lower than the previous estimates based on industry sources. Post adjusted the area and production estimates for MY 23/24 and forecasts for MY 24/25 accordingly based on stable acreage. The official area and production for MY 23/24 is not yet available.

Consumption

Post lowered its forecast for total oilseeds for crushing in MY 24/25 to 136.3 MMT from the previous report's forecast of 136.9 MMT mainly on lower sunflower seed production. MY 24/25 crushing volume is up marginally from MY 23/24 crushing volume of 135.3 MMT. Higher demand for oilseeds for crushing reflects a moderate demand recovery for protein meals in the feed sector. Despite low to negative margins for swine and poultry sectors in the first part of MY 23/24, feed demand continues to grow driving SBM use. Along with declining SBM prices from September 2023, SBM consumption, accounting for about 76 percent of total protein meal for feed use, is expected to recover gradually. Additionally, a moderate recovery of vegetable oil demand and greater soybean food use consumption will increase demand for oilseeds.

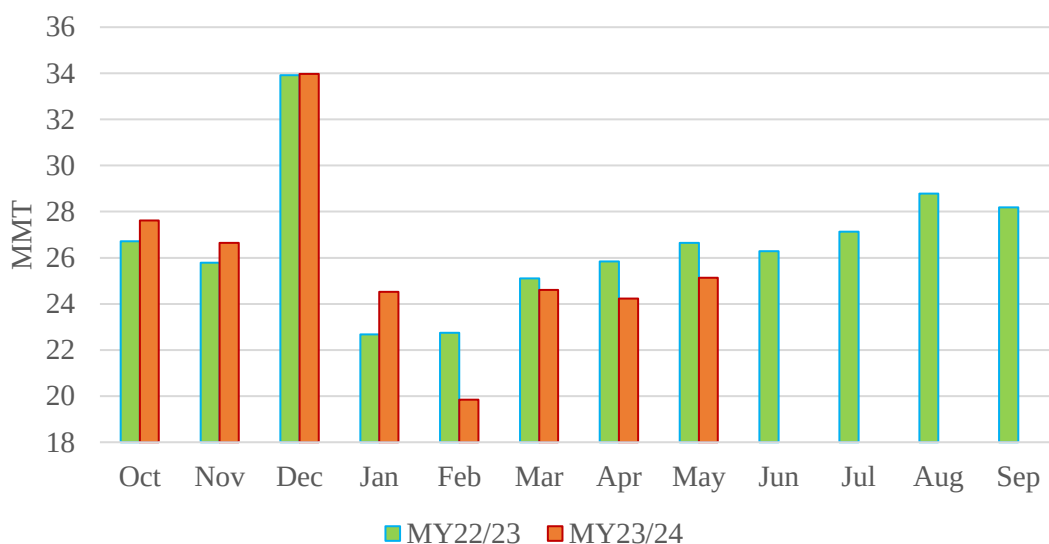

Forecast soybean crushing for MY 24/25 remains unchanged from the previous report at 98 MMT, slightly higher than the MY 23/24 reflecting weak demand growth for soybean products. MY 23/24 soybean crushing is raised moderately on more SBM exports and lower peanut imports for crushing. The feed sector's demand for SBM drives soybean crushing demand. However, the June CASDE report forecast MY 24/25 soybean crush volume at 94.9 MMT, down from the 95.8 MMT in MY 23/24 and even lower than the 95.9 MMT in MY 22/23. CASDE's declining soybean crushing may reflect its wish to achieve MARA's goal of reducing soybean protein meal use in feed. A leading industry consulting source forecast a high crushing volume at 99.7 MMT for MY 24/25, almost unchanged from its estimate for MY 23/24. Another industry source forecast a moderate recovery of soybean crushing volume at 95 MMT in MY 24/25 from its low estimate of 94.5 MMT the previous year. The continuous disagreement by Chinese sources on soybean crushing demand and SBM use in MY 23/24 and MY 24/25 makes it hard to forecast China's soybean demand.

Post raised its forecast for total meal consumption for feed in MY 24/25 to 102.1 MMT from 101.6 MMT from the previous report, which shows a small growth from the MY 23/24 estimate of 101 MMT that post also raised slightly from the previous report. The upward adjustments for total meal use for feed mostly reflects more use of imported rapeseed meal in both years and a moderate demand growth in the feed sector. SBM continues to dominate meal use for feed, accounting for about 74 percent, distantly followed by rapeseed meal at 13.5 percent.

Feed Demand

MY 24/25 feed production is expected to recover from a relatively low production in MY 23/24. Based on a MARA survey, feed production in the first eight months of MY 23/24 declined 1.4 percent year-over-year. However, a high swine capacity in the first eight months and expected demand growth of milk, eggs, and aquaculture products will moderately increase overall feed consumption in MY 23/24.

Chart 3. China: Feed Production Declined in 2024

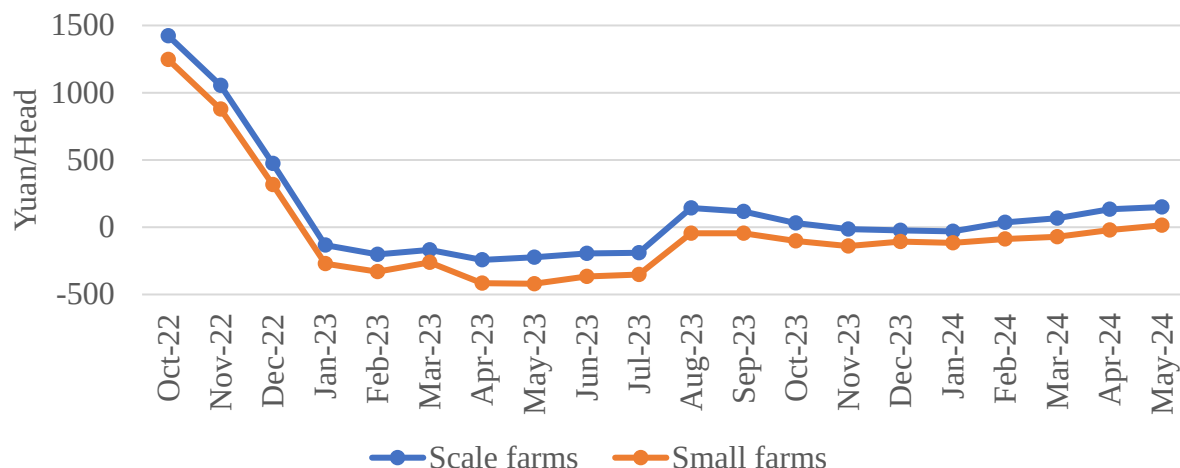

Source: MARA

MARA reported that total production of pork, beef, mutton, and poultry meat was 24.9 MMT in the first quarter of 2024, a year-over-year increase of 1.4 percent; egg production was 8.67 MMT, an increase of 1.5 percent; and milk production was 8.76 MMT, an increase of 5.1 percent from the previous year. Cultured aquatic products also continued growing with marine and freshwater aquaculture products at 4 MMT and 7.8 MMT, respectively, both up 5.7 percent and 4.6 percent, respectively, from the previous year. According to MARA, a high swine capacity with high sow and hog inventories in the first months of MY 23/24 contributed to an oversupply of pork that suppressed prices and attributed to low or negative profits for swine producers.

Industry sources anticipate 2024 pork production to be smaller than the previous year's record level. Despite a 0.4 percent drop in year-over-year pork production in the first quarter of 2024, pork production is likely to witness a more significant fall in the second half of 2024, reducing swine feed consumption accordingly. Based on a MARA survey, total sow inventory at the end of May 2024 was 40 million head, down 6.2 percent from the same time in 2023, yet still higher than MARA's target of 39 million head. MARA's survey showed that total newborn piglets from December 2023 to May 2024 declined 7 percent year-over-year. Post forecasts swine and pork production in 2024 to drop 3 percent from the previous year. Forecast pork production is down to 55.9 MMT in 2024 from 57.9 MMT in 2023, while forecast chicken meat production in 2024 is down 6.3 percent from 2023. For additional information please see: [Livestock and Products Semi-Annual | CH2024-0032](#) and [Poultry and Products Semi-Annual | CH2024-0020](#). Forecast beef production in 2024 is up 2 percent year-over-year to 7.7 MMT.

Chart 4. China: Swine Profits Remains Low or Negative in MY 23/24
(Monthly Average: Yuan/Head)

Source: MARA; data for May 2024 are Post's estimates

The high swine production capacity in the first months of MY 23/24 together with an expected growth of eggs, milk, and aquaculture production imply a moderate increase of overall feed consumption in MY 23/24 is likely, supporting an increased demand of protein meals that is driving oilseed crush demand. In the 2024 China Feed Industry Conference, MARA feed officials analyzed 2023 feed production and forecast a steady growth in feed production in 2024 (Table 3). Overall feed consumption in 2023 is 3 percent higher than the previous year.

Table 3. China: Estimated Total Feed and SBM Consumption and SBM Inclusion Rate

CY/MMT	2019	2020	2021	2022	2023
Total feed consumption	365	396.5	450	454	468
SBM consumption	63.2	70	69	65.8	63.5
Inclusion rate %	17.3	17.7	15.3	14.5	13.6

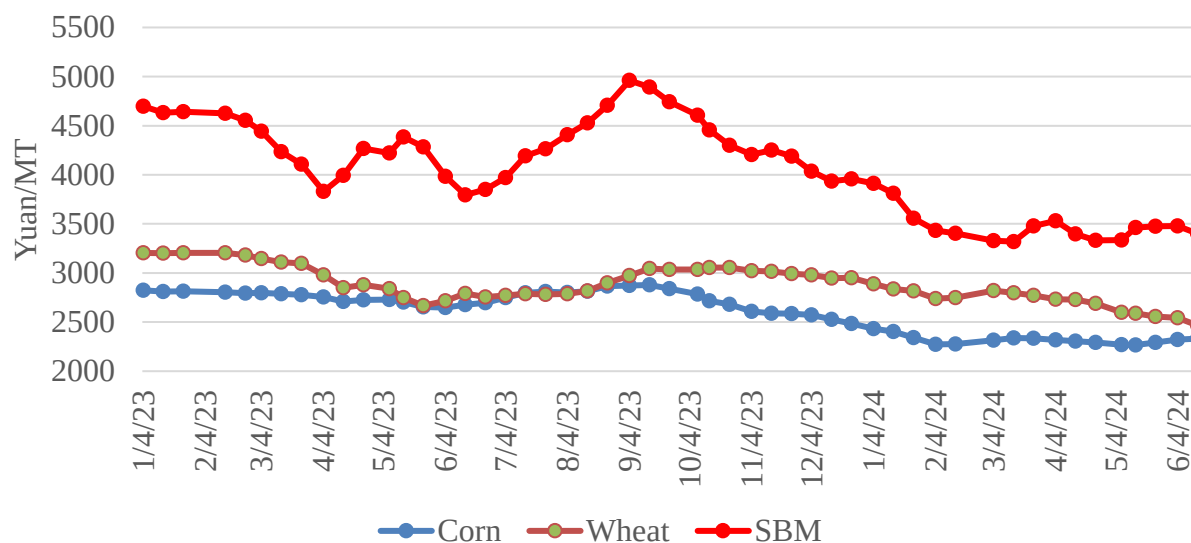

Source: MARA

Note: Calculated on an estimated total feed consumption based on official production volume of all animal products.

SBM Inclusion Rates in Feed

The relatively low and declining SBM prices since the beginning of MY 23/24 could encourage more SBM use in feed production. However, MARA claims that the Program for SBM Substitution and Reduction in Feed has been successful with the SBM inclusion rate in feed declining gradually since 2019 (Table 3). Additionally, MARA data shows the average SBM inclusion rate for the top 33 feed manufacturing enterprises with yearly capacity exceeding 1 MMT or above was 10.8 percent in 2023. MARA continues to request all stakeholders to work together and take measures to reduce/substitute SBM/protein ingredients in feed to reduce production costs for feed and animal products and environmental emissions.

Chart 5. China: Major Feed Ingredient Prices
(Jan 2023- June 2024)

Source: NBS

Recovering Economy Growth Remains Positive for Oilseed Consumption

NBS reported China's GDP in the first quarter of 2024 increased 5.3 percent from the previous year, as compared to the PRC's yearly growth target of 5 percent. Several international agencies forecast a relatively low GDP growth in 2024 for China ranging from 4.5 to 5 percent. GDP growth, though slower than anticipated, is expected to add disposable income to consumers, driving up consumption of animal products and vegetable oils in 2024. Despite a forecast decline in pork production in 2024, the relatively large swine production capacity in the first part of MY 23/24 and the overall production of all animal products will support moderate growth of oilseed consumption in MY 23/24.

Demand for Food Use Soybeans

Post raised its forecast for MY 24/25 soybeans for food use to 16.5 MMT from the 16 MMT in the previous report and up 0.6 MMT from MY 22/23 mainly on a large domestic supply and affordable prices. A recovering food service sector and an increasingly health conscience consumer base is expected to stimulate consumption of soybean products. However, increased domestic soybean production will limit opportunities for imports of non-GE soybeans for food use in MY 23/24. (Note: Imported genetically engineered (GE) soybeans are only allowed for crushing or direct feed use. China does not have a low-level presence policy; thus, all imports of non-GE soybeans must be free from GE soybeans.)

Vegetable Oil Demand

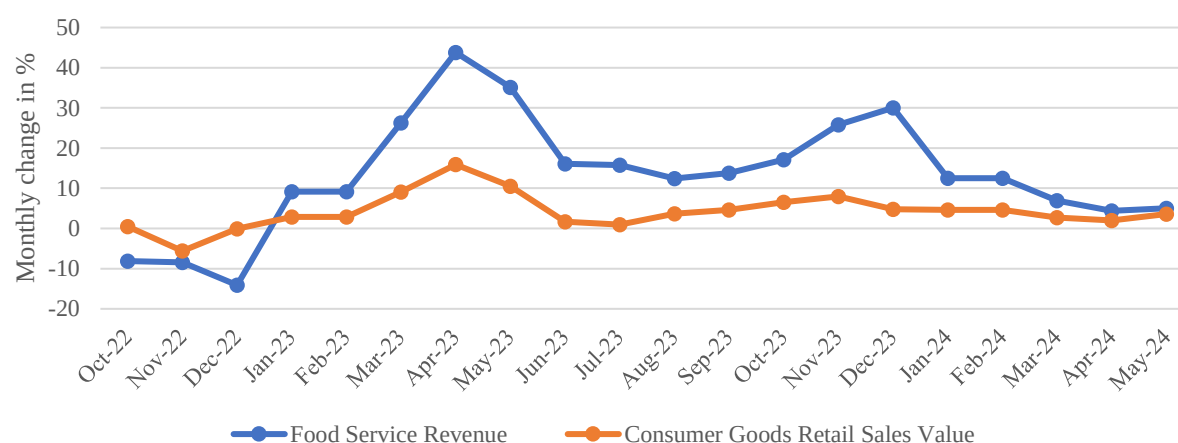

Total vegetable oil for food use is forecast to rise 1.3 percent in MY 24/25 to 36.2 MMT, slightly down from the previous estimate mainly on weaker-than-expected consumption growth. Vegetable oil for food use in MY 23/24 is unchanged from the previous report at 35.7 MMT.

According to NBS, food service revenue in the first 5 months of 2024 increased 8.4 percent year-over-year, with May up 5 percent. The monthly growth rate, however, has been declining since January 2024 (Chart 6). Growth in vegetable oil consumption appears to be slower than previously expected.

Additionally, sales of grains, oils, and food for in-home use increased 9.3 percent in the first five months of 2024. China's booming bakery industry seems to be the main driving force for vegetable oil use. Forecast stable and affordable prices for major oils will support vegetable oil consumption in general.

China's industry sources agree that vegetable oil consumption will continue to grow at a moderate pace in MY 23/24 and MY 24/25. However, the June CASDE report forecast vegetable oil consumption at about 36.7 MMT for MY 24/25, down from 37.4 MMT for MY 23/24, mainly based on an increasingly health conscience consumer base and a declining population. Given the already high yearly per capita consumption, Chinese nutritionists and the relevant organizations have been calling for consumers to be cautious in increase consumption of vegetable oils for health concerns.

Chart 6. China: Food Service Revenue and Consumer Good Retail Sales
(Oct 2022 to May 2024; Year-on-year change)

Source: NBS

Vegetable oil consumption for feed use in MY 24/25 is maintained at 1.3 MMT, only slightly up from the 1.2 MMT in MY 23/24. Decreased prices for major feed ingredients, including corn and lower priced animal fat, are expected to restrict the growth of vegetable oil use for feed. The vegetable oil inclusion rate in feed typically increases when use of wheat and rice increases to replace higher-priced corn, with the oil adding calories and improving palatability.

Table 4. China: Prices for Major Vegetable Oils
(MY22/23 to MY24/25 Yearly Average; Yuan/MT)

	MY22/23	MY23/24	MY24/25**
Soybean oil*	8,862	8,000-10,000	8,000 - 10,000
Rapeseed oil*	10,747	9,000 - 11,000	9,000 - 11,000
Peanut oil*	16,705	15,500 - 17,000	15,500 - 17,000
Palm oil (imported after tariff price)	8,093	7,000 - 9,500	7,000 - 9,500

Source: MARA June CASDE report; *Ex-factory price; ** June CASDE estimated price range

Storage Capacity and Auction of Soybean Reserve

The National Food and Strategic Reserve Administration (NFSRA) reported that the PRC's national standard grain storage capacity exceeded 700 MMT at the end of 2023, an increase of 36 percent from 2014. Out of the total, the temperature-controlled storage capacity is 200 MMT. The comprehensive loss rate during the grain storage cycle of state-owned grain warehouses is controlled within a reasonable range of 1 percent. The PRC has sufficient storage capacity to maintain grain and oilseeds stocks to meet its grain security targets. Although there are no specifics on the storage levels that the PRC considers adequate for food security for grain and oilseeds, import demand for these strategic commodities can be unpredictable as the import demand is not just based on market conditions but also on demand to replenish reserves. The estimated yearly total grain consumption is about 635 MMT (313 MMT for corn, 145 MMT for rice milled, 154 MMT for wheat, 11 MMT for sorghum, and 12 MMT for barley), and soybean consumption is about 120 MMT. Current estimated soybeans stocks are above 36 MMT.

On March 19, the PRC started the 2024 auction of state soybean reserve (imported soybeans for crushing). Based on industry sources, approximately 7.2 MMT of soybeans were offered in 15 auctions as of June 21; however, only about 1.2 MMT were sold. The purchase rate at about 16 percent reflects a weak demand from the crushing sector, despite the selling price remaining low. The PRC has held auctions in the last three years to rotate its old reserve. The auctions continued June 28 with 0.96 MMT of soybeans. These auctions may reduce the industry's import intentions.

Trade

Soybeans

Soybean imports are forecast unchanged from Post's previous report at 103 MMT in MY 24/25 and unchanged from Post's estimate for MY 23/24. Stable imports for MY 24/25 are based on a slight increase in crushing demand from a modest increase in SBM consumption as lower prices allow feed mills to push up inclusion rates. Post contacts have shared their belief that strong harvests in Brazil and Argentina are expected to result once again in high carryover in stocks at the start of MY 24/25.

Forecasting soybean imports is increasingly difficult by the expanding discrepancies between China's released soybean arrivals and the combined departures of exporting countries (See more analysis in [Oilseeds and Products Annual CH2024-0042](#)). Based on Trade Data Monitor, LLC. (TDM), China's soybean imports in the first eight months of MY 23/24 were 60.3 MMT, down 1.1 percent year-over-year, and total imports for MY 22/23 are 97.4 MMT. Both are lower than the combined export volume of exporting countries during the same period, taking into consideration the necessary shipping time. TDM shows China's soybean imports averaged about 34.4 MMT from June to September in the last three marketing years. This implies MY 23/24 soybean imports by China's official statistics may be around 95 MMT only. Table 5 shows the different perspectives on China's soybean imports in MY 23/24 and MY 24/25 by Chinese sources as compared to Post.

Table 5. China: Forecast/Estimates of Soybean Imports by Sources (MMT)

	CASDE	CNGOIC	China JCI	An Industry Source	FAS/China
MY 23/24	96.1	97	99.5	97	103
MY 24/25	94.6	NA	99.6	97	103
Year-over-year change in %	-1.6	NA	+0.1	+0	+0

Note: CNGOIC – China National Grain and Oils Information Center

Based on TDM, in the first eight months of MY 23/24, China's imports of U.S. soybeans declined to 17.2 MMT, accounting for 28.6 percent of China's soybean imports, far below Brazil's 39.8 MMT and 66 percent market share. The average import price from Brazil remained at \$45/MT or 7.8 percent below the average price from the United States. U.S. soybean exports to China will continue to face fiercer competition from a forecast higher production in Brazil and Argentina in MY 24/25.

Rapeseed

Forecast rapeseed imports for MY 24/25 remain unchanged at 4 MMT from the previous report and higher than the lowered estimate of 3.5 MMT for MY 23/24. The relatively high imports reflect China's recovering demand of rapeseed products and preference for imports of rapeseed rather than meal/oil when global rapeseed supply improves. Rapeseed imports from Canada, the largest supplier, are expected to fall in MY 23/24 on lower Canadian production. Higher imports of rapeseed meal and oil will make up for the reduced imports from Canada.

Rapeseed imports in the first eight months of MY 23/24 were 3.1 MMT, 24 percent lower than the previous year mainly due to a 1 MMT decline of imports from Canada. Higher Imports of rapeseed meal and oil also discouraged rapeseed imports in the first months of MY 23/24. The continuous increase of aquaculture production and the local crushing capacity both remain driving forces for imports of rapeseed and products.

Peanuts

Post lowered MY 23/24 peanut imports to 0.65 MMT from a previous estimate at 1 MMT and reduced MY 24/25 imports to 0.9 MMT. In the first eight months of MY 23/24, peanut imports decreased to about 0.46 MMT, significantly down from the 0.81 MMT the previous year. Shelled peanut imports from the largest supplier, Sudan, plummeted to 68,000 MT from the 363,000 MT in the previous year mainly due to Sudan's low peanut production. Peanut imports from the United States increased to 60,000 MT as compared to the 54,000 MT in the previous year. A forecast smaller domestic production is likely to drive a recovery of peanut imports in MY 24/25.

On May 24, 2022, [China signed a phytosanitary protocol with Brazil on imports of shelled peanuts, \(link in Chinese\)](#) implying future competition for the China peanut market. However, imports from Brazil in the first eight months of MY 23/24 continued to be very small at about 110 MT.

Meals

Post raised rapeseed meal imports to 2.5 MMT for MY 23/24 and MY 24/25 from 2.1 MMT and 2 MMT, respectively, in the previous report. In the first eight months of MY 23/24, rapeseed meal imports surged to 2 MMT, up 48 percent year-over-year. With diversified import origins and stable domestic

demand, increased imports of rapeseed meal met the supply gap from decreased rapeseed imports from Canada in MY 23/24. Post forecasts stable rapeseed meal imports in MY 24/25.

Forecast sunflower seed meal imports remain unchanged at 3 MMT for both MY 24/25 and MY 23/24. In the first eight months of MY 23/24, sunflower seed meal imports were 2.1 MMT, 0.1 MMT less than the same time the previous year. Declining SBM prices will reduce demand for sunflower seed meal import for the remainder of 2024. Ukraine had a market share of around 73 percent but saw declining volumes to China, while imports from Bulgaria and Russia also decreased during the first eight months of MY 23/24.

Fishmeal imports in the first five months of 2024 stood at about 0.7 MMT, down from the previous year. [The Marine Ingredients Organization](#) forecasts stable fish meal production in 2024 of its covered producing countries. Post maintains fishmeal imports at 1.8 MMT in MY 24/25 and 1.7 MMT for MY 23/24 on a generally stable global fish meal production and China's continued robust demand from the aquaculture sector.

Forecast SBM exports are unchanged at 1 MMT for MY 24/25, while estimate for MY 23/24 is raised slightly to 1.1 MMT based on increased exports at 0.88 MMT in the first eight months of MY 23/24. SBM imports are insignificant.

Vegetable Oil

Post reduced MY 23/24 vegetable oil imports to 10.3 MMT from the 10.6 MMT in the previous report based on low imports of palm oil that were slightly offset by high rapeseed oil imports. Forecast MY 24/25 vegetable oil imports are also lowered to 10.3 MMT from the previous 10.8 MMT on small palm oil imports and slightly raised rapeseed oil imports. Vegetable oil imports during the first eight months of MY 23/24 fell to 5.8 MMT from 7 MMT in the previous year reflecting a weak recovery in consumption. Vegetable oil import growth is limited due to adequate domestic crushing of oilseeds and weak consumption growth in MY 24/25.

Palm oil imports for MY 23/24 and MY 24/25 are both lowered to 6.1 MMT and 6 MMT, respectively, from the 6.6 MMT and 6.7 MMT, respectively, in the previous report. Palm oil imports in the first eight months of MY 23/24 were 2.9 MMT, down 29 percent year-over-year, despite a 11 percent drop in import prices. Demand recovery for food processing, particularly instant noodle production, together with weaker-than-expected home and food service use discouraged palm oil imports.

Rapeseed oil imports are raised to 2 MMT in MY 23/24 and 1.9 MMT in MY 24/25, respectively, from the 1.7 MMT for both years in the previous report mainly on increased imports from Russia and Ukraine at lower prices, while imports of rapeseed from Canada declined.

Sunflower seed oil imports for MY 23/24 and MY 24/25 are unchanged at 1.4 MMT from the previous report.
