

Required Report: Required - Public Distribution

Date: March 09, 2026

Report Number: TU2026-0009

Report Name: Oilseeds and Products Annual

Country: Turkiye

Post: Ankara

Report Category: Oilseeds and Products

Prepared By: FAS Staff

Approved By: Michael Francom

Report Highlights:

With better weather conditions heading into the spring planting season and growing animal feed demand, Turkiye's total oilseed production in marketing year (MY) 2026/27 is forecast to climb higher year-to-year. Despite this anticipated increase, Turkiye will continue to rely on imported oilseeds and their derivative products to satisfy the country's growing domestic and export requirements. In the case of soybeans, imports are forecast to hit a new record in MY 2026/27, with a sizeable portion likely coming from the United States.

Oilseeds

In MY 2026/27, Türkiye's total production of oilseeds – sunflowerseeds, cottonseeds and soybeans – is projected to increase slightly year-over-year to nearly 2.6 million metric tons (MMT). This increase in overall oilseed production is primarily attributed to the projected expansion in sunflowerseed production which will more than offset the forecasted contraction in cottonseed production. Improved weather conditions will also play an important factor in lifting production higher.

In contrast to the last two growing seasons, which suffered drought-related setbacks, there is more optimism heading into the spring planting season for MY 2026/27 crops because of favorable precipitation levels in the autumn and winter months. According to the Turkish State Meteorological Service, rainfall across the country from October to February was close to the long-term average and 38 percent higher than last year.

However, even with the wetter weather, water levels at many of the country's reservoirs remain far below average. This dynamic could impact the availability of irrigation water. Furthermore, if spring and summer rains are insufficient, municipal authorities in drier parts of the country may intervene and stop water from being used for irrigation purposes.

At the same time, two consecutive years of drought has already taken its toll, forcing farmers to rethink their planting decisions. For instance, farmers hit the hardest the past drought, especially in the Thrace and Aegean regions, are planning to or have already switched to alternative crops requiring less water. Thrace farmers in northwest Türkiye have opted to plant more canola since it requires even less water than sunflowers. With this anticipated switch, canola production is predicted to triple year-to-year to 300,000 MT in MY 2026/27.

Meanwhile, Aegean farmers on the west coast of Türkiye intend to plant less cotton and more corn, wheat, and sunflowers, depending on the availability of irrigation water. The switch away from cotton is being driven by past drought concerns and depressed cotton prices.

In the fall of 2024, in recognition of the growing drought pressures facing the country, the Ministry of Agriculture and Forestry announced an Agricultural Production Plan (GAIN TU2025-0012) that prioritizes water conservation by incentivizing the production of less water intensive crops in water scarce regions. According to industry sources, the plan's effects may be more apparent this year.

Area Harvested – Sunflowerseed:
The MY 2026/27 harvest area for sunflowerseeds is projected to expand slightly year-to-year to 760,000 hectares (ha). This forecasted expansion is based on market expectations that farmers, especially in regions with limited irrigation and facing potential water constraints, will increase their production of

drought-resistant crops such as sunflowers. This growth in area harvested is expected to be most pronounced in Central Anatolia and Aegean regions, located in the central and western parts of the country, and to a lesser degree in southeastern Türkiye.

The Ministry of Agriculture & Forestry's newly implemented Land Utilization Enhancement Project (TAKE) will distribute free seeds to farmers in marginal areas with water restrictions to encourage them to grow increased production of drought resistant crops like sunflowers. This program is expected to support the anticipated expansion in area harvested.

While different regions are expecting an expansion in area harvested, the Thrace region in the northeast part of Türkiye, which accounts for most of the country's sunflowerseed production, is actually expected to see a 10-15 percent contraction in area harvested compared to last year. After last year's disappointing losses due to drought, farmers in the Thrace region have already switched some of their fields to barley and canola in hopes of better profit margins. Barley and canola are winter crops and were planted last fall.

The MY 2026/27 sunflower seed harvest area will be divided between crushing, confectionery and planting seeds. The projected expansion in area harvested will mainly come from sunflower seeds for crushing. Sunflower planting for the MY 2026/27 season will begin at the end of March and end in May.

Production – Sunflowerseed

Assuming an expansion in area harvested along with better yields, MY 2026/27 sunflowerseed production is forecasted to increase year-to-year by 25 percent to almost 1.6 million metric tons (MMT), which is more in line with historical averages. Yields are forecasted higher, assuming normal weather conditions prevail in sunflower-growing areas. With favorable precipitation levels in recent months, the threat of severe drought conditions like the previous marketing year have eased.

In line with historical trends, about 85 percent of sunflowerseed production in MY 2026/27 is expected to be oilseeds and the remainder will be divided between confectionary and planting seeds.

Post is reducing its MY 2025/26 production and yield estimates, based on worse than expected drought conditions, especially in the Thrace region.

Consumption – Sunflowerseed

MY 2026/27 sunflowerseed consumption is expected to decline year-to-year to about 2.4 MMT, assuming the government will throttle back on its interventions in the marketplace to facilitate sunflowerseed imports. The anticipated reduction in crush demand is expected to be offset by an increase in imported sunflowerseed meal.

The MY 2025/26 consumption estimate is adjusted higher to nearly 2.55 MMT, based on the expectation that crush demand will increase in response to the government's actions to lower customs duties on imported sunflowerseeds.

Trade – Sunflowerseed

Imports

With the projected increase in domestic sunflowerseed production and the expected discontinuation of reduced customs duties on imported sunflowerseed, imports in MY 2026/27 are expected to plunge year-to-year to 900,000 MT.

The MY 2025/26 import estimate was adjusted significantly higher to 1.4 MMT, based on latest trade data (Sep-Oct) that shows a ten-fold increase in imports from the same time last year. This huge jump in imports was linked to the government's decision to temporarily lower import duties on sunflowerseed (and crude sunflowerseed oil) to avoid potential shortages and price increases resulting from drought conditions inside Türkiye. These interventions included a lower-duty tariff rate quota (TRQ) for 1.0 MMT of sunflowerseed (or 400,000 MT of sunflowerseed oil) and lower tariffs, as shown in tables 1 and 2.

As a result of these actions, sunflowerseed imports during the first quarter of MY 2025/26 (Sep-Dec) skyrocketed upward, reaching almost 580,000 MT. The leading suppliers were Romania (350,000 MT), Moldova (140,000 MT) and Bulgaria (45,000 MT).

Table 1: Tariff Rates for Sunflower Seed and Oil from Oct 2025-Sep 2026

HS Code	Commodity	Bound MFN Rate	Applied MFN
1206.00.99.00.19	Sunflower seed	27	12 (Oct 2025-May 2026) 20 (Jun 2026-Sep2026)
1512.11.91.00.00	Crude Sunflower oil	36	30 (Oct 2025-Sep 2026)

Table 2: In-Quota Tariff Rates for Sunflower Seed and Oil from Jan-May 2026

HS Code	Commodity	Quota Amount	Bound MFN Rate	In-Quota Tariff	Out of Quota Tariff	Period for Quota
1206.00.99.00.19	Sunflower seed	1 MMT*	27	0	12	1/1/2026-5/31/2026
1512.11.91.00.00	Crude Sunflower oil	400,000 MT	36	20	30	

*1 MMT of sunflower seed is equivalent to 400,000 MT of crude sunflower oil.

Figure 2: Sunflowerseed and Sunflower Oil Imports vs Sunflower Oil Exports (Metric Ton)

* Estimate **Forecast

Exports

MY 2026/27 sunflower seed exports are expected to remain almost unchanged from the previous year at 100,000 MT. According to Post's analysis, approximately one-fourth of this estimated amount will be transshipments from Black Sea countries to neighboring countries, while the remainder will consist of domestic confectionery seed and hybrid sunflowerseeds for planting purposes.

The MY 2025/26 export estimate was left at 100,000 MT, based on the latest export figures for the first four months (Sep-Dec) of the marketing year. The leading export destinations were Syria (8,500 MT), Bulgaria (6,700 MT), and Russia (6,299 MT).

Stocks – Sunflowerseed

In MY 2026/27, sunflowerseed stocks are forecast to remain unchanged from the previous year at 76,000 MT and in line with historical amounts. Most sunflowerseed stocks are held by the private sector.

Area Harvested – Soybeans

MY 2026/27 soybean area harvested is projected incrementally higher from last year to 39,000 hectares, based on expectations that farmers will continue to gradually expand plantings of soybeans, including organic beans, in hopes of capturing higher profit margins.

Post anticipates that this expansion in area harvested will mostly occur in Southeastern Anatolia where farmers, because of depressed cotton prices, are switching from cotton to soybeans and other row crops. Soybeans will mainly be grown as a second crop, with most of the production concentrated in the Cukurova region in the south-central part of the country bordering the Mediterranean Sea. The planting of the MY 2026/27 soybean crop is expected to begin in April and finish at the end of May.

The area harvested for the 2025/26 marketing year remains at 38,000 hectares. Small trial soybean plantings have recently begun in the Central and Southeastern Anatolia regions, as well as in the Black Sea region. Depending on the outcome of these trials, these regions may increase soybean planting in the future. However, volumes are expected to remain relatively small since other row crops are expected to be more profitable than soybeans for the foreseeable future. Soybeans are still predominantly viewed as a rotational crop for revitalizing soil health rather than as a cash crop.

Production – Soybeans

With the incremental expansion in area harvested, MY 2026/27 soybean production is forecast nominally higher year-to-year at 160,000 MT. Yields are forecasted higher, assuming normal weather conditions prevail in the country's soybean-growing areas. With favorable precipitation levels in recent months in most parts of the country, the threat of severe drought conditions like the previous marketing year have eased.

In recent years, Türkiye has reportedly increased its production of organic soybeans, though these represent just a small fraction of overall soybean production. According to different sources, a large percentage of organic soybeans produced in Türkiye are exported, including to the United States.

Consumption – Soybeans

MY 2026/27 soybean consumption is forecast modestly higher from last year to about 4.4 MMT, based on the growing demand for soybeans and by-products, especially in poultry feed rations. The continued expansion in the poultry industry and, to a lesser extent, in the emerging aquaculture industry will help drive increased soybean consumption.

The MY 2025/26 consumption estimate for soybeans is adjusted higher year-to-year to 4.2 MMT because of stronger-than-expected crush demand.

Trade – Soybeans

Imports

Soybean import volumes are forecasted to keep rising, hitting a record of almost 4.4 MMT in MY 2026/27, as the demand for animal feed continues to expand. This prediction reflects a decade old trend in which soybean import levels have doubled.

Despite a temporary slowdown in imports during the first four months of MY 2025/26 (Sep-Dec), soybean imports are estimated to remain fairly steady year-to-year at 4.2 MMT. According to industry sources, soybean imports briefly slowed towards the end of the calendar year because shipments of Ukrainian soybeans were delayed because of wartime conditions in that country. The pace of soybean imports from major suppliers is expected to pick up starting in January.

MY 2025/26 soybean imports from September-December totaled 891,000 MT, which was 16 percent lower than the same period the prior year. The leading suppliers were the United States (442,000 MT), Ukraine (358,000 MT), and Brazil (60,000 MT).

Exports

MY 2026/27 soybean exports are forecast to slightly increase year-over-year to 160,000 MT. Based on Post's analysis of historical trade data, the majority of this forecasted amount is expected to be transshipments, mostly from Black Sea countries, while the others will predominately be domestic organic soybeans.

The MY 2025/26 soybean export estimate is revised marginally higher from the prior year to 160,000 MT. During the first four months of MY 2025/26 (Sep-Dec), soybean exports totaled a little more than 29,000 MT. The main export destination was the United States (28,000 MT). According to U.S. import data, some of these Turkish soybeans sent to the United States were organic.

Stocks – Soybeans

For MY 2026/27, soybean stocks are forecast unchanged from the prior year's updated number at around 300,000 MT.

OFFICIAL DATA CAN BE ACCESSED AT: PSD Online Advanced Query						

Area Harvested – Cottonseed

MY 2026/27 cotton area harvested is projected to contract year-to-year by about 18 percent to 360,000 hectares. This anticipated contraction is based on multiple interrelated factors, including depressed international cotton prices, sluggish domestic demand for cotton, and the option to plant more profitable row crops like wheat, sunflowerseeds, and corn. Cotton planting will start in April and finish by May.

Production – Cottonseed

In line with the expected contraction in area harvested, MY 2026/27 cottonseed production is forecast lower year-over year at 900,000 MT. This forecast assumes that cotton growers will have sufficient access to irrigation water.

Although rainfall has been good across Turkiye in recent months, the effects of severe drought of the past two years remains visible in the lower-than-normal water levels [in some of the reservoirs](#) around the country. If spring rains are inadequate, especially in the Aegean and Southeastern Anatolia regions, regional authorities may impose water restrictions that would more than likely cut into production volumes of cotton and cottonseed. More detailed information about Turkiye's cotton production situation will be available in our forthcoming cotton annual report.

Consumption – Cottonseed

MY 2026/27 cottonseed consumption is forecast at about 914,000 MT, down year-to-year by nearly 80,000 MT because of the expected decrease in domestic cottonseed production. Almost all consumption originates from domestically grown cottonseeds.

Trade – Cottonseed

MY 2026/27 cottonseed imports are projected to remain unchanged from the previous year at 20,000 MT. Cottonseed imports are generally very small because of the availability of substitutes, like domestic sunflowerseeds or imported soybeans.

MY 2025/26 cottonseed imports are estimated lower year-to at 20,000 MT owing to a downturn in shipments from Azerbaijan. Cottonseed imports during the first three months (Oct-Dec) of the marketing year fell almost 40 percent year-over-year to nearly 2,300 MT with nearly all of these imports coming from Azerbaijan. Contacts expect the pace of imports will accelerate a little during the latter part of the marketing year.

Stocks – Cottonseed

MY 2026/27 cottonseed stocks are forecast at 8,000 MT, nearly unchanged from the previous year and in line with historical trends.

OILSEED MEALS

In 2026/27, total oilseed meal production, including sunflower meal, soybean meal, and cottonseed meal, is estimated to be approximately 4.1 MMT, close to the previous year's level. The production of canola meal, which is still relatively small compared to other oilseed meals, is expected to surge to 150,000 MT, owing to the anticipated expansion in the domestic canola crop in MY 2026/27. Türkiye's total crushing capacity is about 9.0 MMT.

During this same period, oilseed meal consumption is projected to increase by about 2 percent to 5.4 MMT. This anticipated growth is in response to the rising demand for compound feed needed to produce more meat, milk, eggs, and fish for domestic and export markets. Based on sectoral statistics as shown in table 3, the production of compound feed, a large share of which includes oilseed meals, grew by nearly five percent last year. This expansionary trend in compound feed production will continue for the foreseeable future as Türkiye continues building its livestock, poultry, and aquaculture sectors.

According to a recent [report](#) from the Turkish Statistical Institute (TUIK), chicken meat production grew 11 percent to 2.8 MMT in calendar year 2025. At the same time, TUIK [livestock data](#) shows that the number of cattle, goats, and sheep increased by a handful of percentage points, as shown in table 4.

Table 3: Compound Feed Production in Turkey by Sectors (Million MT)

Production – Sunflowerseed Meal:

MY 2026/27 sunflowerseed meal production is forecast lower-year-year to about 1.2 MMT. This prediction assumes that the lower duties on imports of sunflowerseeds from the preceding marketing year will snap back to normal levels with the anticipated increase in domestic sunflowerseed production.

MY 2025/26 sunflowerseed meal production is adjusted higher to almost 1.3 MMT, based on an increase in sunflowerseed imports resulting from the government’s decision to lower tariffs.

Consumption – Sunflowerseed Meal:

MY 2026/27 sunflowerseed meal consumption is projected to increase slightly from the previous year to about 2.1 MMT. This forecasted amount assumes that the utilization of sunflowerseed meal will expand in line with the growing demand for animal feed.

Trade – Sunflowerseed Meal:

Imports

Even with the predicted increase in domestic production of sunflowerseed meal, MY 2026/27 imports are projected to soar higher to 975,000 MT to meet the growing demands of the feed sector. This prediction assumes Black Sea suppliers will have available supplies for sale at competitive prices.

The MY 2025/26 sunflowerseed meal import estimate is slashed lower to 750,000 MT, based on the expectation that the anemic year-to-date export performance will continue through the rest of the marketing year. Meal imports are currently less attractive because of the lower duty on imported sunflowerseeds. Imports during the first four months (Sep-Dec) of the current marketing year fell to about 277,000 MT. The leading suppliers were Russia (244,000 MT), Ukraine (9,500 MT), and Romania (9,000 MT).

Stocks – Sunflowerseed Meal

In MY 2026/27, sunflowerseed meal stocks are forecast at 115,000 MT, similar with the previous year's newly revised figure. Most sunflowerseed stocks are held by the private sector which, because of financial reasons, have tended to operate with minimal stocks in recent years.

(1000 MT) ,(PERCENT)

OFFICIAL DATA CAN BE ACCESSED AT: [PSD Online Advanced Query](#)

Production – Soybean Meal:

Assuming that crush demand will continue to incrementally expand each year, soybean meal production in MY 2026/27 is projected to slightly increase from last year to 2.4 MMT. Soybean meal production, most of which will be made from imported soybeans, has grown in recent years due to favorable

crushing margins and increased utilization in animal feed rations, especially for poultry and aquaculture feed.

Soybean meal production in MY 2025/26 is estimated at nearly 2.3 MMT, slightly higher than prior year for the same reasons mentioned above.

Consumption – Soybean Meal:

MY 2026/27 soybean meal consumption is forecast slightly higher from the previous year to about 2.9 MMT, which is in line with the recent trend of expanding utilization of soy meal in animal feed, especially in poultry and aquaculture rations. The MY 2025/26 consumption estimate for soybeans meal is adjusted higher to 2.8 MMT for these same reasons.

Trade – Soybean Meal:

Imports

MY 2026/27 soybean meal imports are forecast to climb higher year-to-year to 1.6 MMT, assuming an increase in domestic animal feed demand and steady transshipment business. Based on past trade patterns, almost half of the forecasted import volumes are expected to be transshipments to neighboring countries.

MY 2025/26 soy meal import volumes are estimated at 1.5 MMT. Shipments during the first four months (Oct-Dec) of the marketing year doubled year-over-year, topping 518,000 MT with most shipments coming from Argentina (463,000 MT). Import levels of soymeal jumped temporarily higher during this period because of disruptions to imported whole soybeans originating out of Ukraine in late 2025. Soymeal shipments for the rest of the marketing year are expected to resume at a more normal pace.

Exports

MY 2026/27 soybean meal exports are forecast at about 1.2 MMT, a large share of which are expected to be transshipments to neighboring countries that have underdeveloped feed industries. According to contacts, Iraq and Syria depend on transshipped soymeal cargoes to support their poultry industries.

In line with the latest trade figures and market expectations, the MY2025/26 soybean meal export estimate is revised higher to almost 1.1 MMT. Export volumes during the first three months (Oct-Dec) of the marketing year were up seven percent compared to last year at 330,000 MT, with the leading export destinations including Iran (94,000 MT), Syria (82,000MT), and Iraq (55,000 MT).

Stocks – Soybean Meal

In MY 2026/27, soybean meal stocks are forecast at 329,000 MT, unchanged from the previous year's newly revised estimate. All stocks are held by private companies, and some are being stored for re-export.

Cottonseed Meal

OFFICIAL DATA CAN BE ACCESSED AT: PSD Online Advanced Query						

Production – Cottonseed Meal

Cottonseed meal production in MY 2026/27 is forecast to modestly decrease year-over-year to 498,000 MT, based on the expected contraction in domestic cottonseed production.

Consumption – Cottonseed Meal

MY 2026/27 cottonseed meal consumption is forecast down from the previous year to 506,000 MT, paralleling the decrease in domestic cottonseed meal production. Almost all the cottonseed meal consumed is made from domestically grown cottonseed.

Trade – Cottonseed Meal

Imports

With the projected contraction in cottonseed meal production, MY 2026/27 cottonseed meal imports are forecast to increase year-to-year to 10,000 MT.

Based on latest trade numbers to date, the MY 2025/26 cottonseed meal import estimate is adjusted lower to 6,000 MT, based on a downturn in imports from Syria that is expected to continue through the rest of the marketing year. According to sources, Syria has curbed exports of cottonseed meal and is instead trying to use the feed ingredient to help support its own livestock sector.

Exports

Cotton seed meal exports for MY 2026/27 are forecast to remain unchanged from the previous year's newly revised figure of 2,000 MT. This forecast assumes that most of this trade are transshipments to third country markets.

Based on latest trade figures, the MY 2025/26 cottonseed meal export estimate has been cut to 2,000 MT.

Stocks

The feed sector does not hold any inventories of cottonseed meal.

VEGETABLE OILS

The total vegetable oil production in MY2026/27 is projected to bubble up by six percent year-to-year to approximately 2.0 MMT. This forecasted growth is based on the expected increase in soybean oil and olive oil production, which more than offsets the anticipated contractions in sunflower oil and cottonseed oil production.

Sunflower oil is the most widely produced, imported, and consumed vegetable oil by Turkish households. Olive oil and cottonseed oil are other important oils produced in Turkey, but they are not imported. Soybean oil is the least consumed oil despite being produced in significant quantities. Most soybean oil has to be exported because it made from genetically engineered beans that are not allowed to be used in food. Consumers also use vegetable oils produced from canola, corn, and safflower oils, depending on price and availability. In addition, although not included in this report, imported palm oil is also used in a wide range of applications, from margarine to vegetable oil.

Table 5: Vegetable Oil for Human Consumption (1,000 MT)

Total	1,524	1,551	1,559

Source: USDA PSD

Turkiye depends on large quantities of sunflower oil and seeds, mainly from Black Sea countries, since it doesn’t produce enough oilseeds and vegetable oil to meet both its domestic and export requirements. Turkiye imports significant amounts of crude sunflower oil for refining and re-exporting to neighboring countries. Additionally, Turkiye also exports domestic olive oil and soybean oil, some of which is made from U.S. soybeans.

Turkey continues to invest in expanding its capacity to crush oilseeds and to refine crude vegetable oils. In 2025, Turkey’s total crushing capacity was approximately 9.0 MMT and its oil refining capacity was approximately 4.5 MMT. Additional capacity will come online in MY 2025/26 with the scheduled opening of two new crushing operations producing high-protein soybean meal and oil.

The Turkish government regularly intervenes in the market to stabilize vegetable oil prices by adjusting customs duties on imported sunflowerseeds and sunflower oil. Faced with the possibility of sunflower oil prices rising due to drought-related production losses, the government introduced measures to lower the tariffs on imported sunflowerseed and sunflower oil in MY 2025/26.

Production – Sunflowerseed Oil

The production of sunflowerseed oil in MY 2026/27 is projected at 936,000 MT, down year-over-year by around eight percent. This decrease is mostly attributed to the expected lower crush compared to the previous year.

Sunflowerseed oil production in MY 2025/26 is estimated at 1.0 MMT, up around 200,000 MT compared to previous year. This increase is based on the latest trade data and Turkey's market interventions that encouraged larger volumes of lower duty sunflowerseed.

Consumption – Sunflowerseed Oil

MY 2026/27 sunflower oil consumption is forecast nominally lower from the previous year to about 1.16 MMT. This anticipated decrease is based on the expectation that there will be more olive oil in the marketplace.

MY 2025/26 sunflower oil consumption is estimated higher year-to-year at 1.24 MMT, based on the increased availability of sunflower oil resulting from the government's lower-duties for sunflowerseed or crude sunflower oil. Despite this intervention, which was aimed at curbing the rising cost of sunflower oil, prices continued along an upward trajectory. Refined sunflower oil is currently selling on supermarket shelves at approximately 80 TL/liter (\$1.8/liter), which is about 30 percent higher than last year.

Domestic crude sunflower oil prices finished 2025 at around \$1,570/MT, an increase of approximately 30 percent compared to the previous year, while the CIF Marmara crude sunflower oil price was around \$1,250/MT, an increase of around 25 percent compared to the previous year.

Trade – Sunflowerseed Oil

Imports

With an increase in domestic sunflowerseed oil, MY 2026/27 sunflowerseed oil imports are forecast slightly higher year-to-year at 1.29 MMT. This projection assumes that the government will not continue its lower tariff rates to spur imports.

MY 2025/26 sunflowerseed oil imports are estimated higher year-on-year to about 1.3 MMT. The increase assumes strong transshipment business, steady re-export demand, and an increase in imports for domestic consumption. The government's decision to temporarily lower import tariffs on sunflowerseed oil and sunflowerseeds is also helping drive an increase in imports. Separately, the government-affiliated Turkish Grain Board (TMO) imported crude sunflower oil at the beginning of the marketing year, had it refined, and is now selling it at its discount outlets to keep vegetable oil prices from rising.

From September to January in MY 2025/26, sunflowerseed oil imports reached nearly 370,000 MT, up more than 8 percent from the same period last year. The leading suppliers were Russia (307,000 MT) followed by Ukraine (33,000 MT). Imports of Ukrainian sunflower oil are down 60 percent from the same time last year. Contacts report that war-related damages to Ukraine's crushing industry is contributing to reduced import volumes of Ukrainian sunflower oil and meal.

Exports

MY 2026/27 sunflowerseed oil exports are projected slightly higher than the previous year at 1.07 MMT, assuming strong re-export and transshipment volumes to key markets in Africa and the Middle East. According to contacts, demand in these regional markets is expected to keep growing since consumers prefer sunflower oil compared to cheaper alternatives such as palm and soybean oils.

The MY 2025/26 sunflowerseed oil export estimate is 1.06 MMT, up around five percent year-over-year based on steady demand from regional markets. In the first four months of MY 2025/26 (Sep-Dec), exports increased to 321,000 MT, up about 11 percent compared to the same time last year. The main export destinations were Iraq (62,000 MT), Djibouti (58,000 MT), and Syria (41,000 MT).

Stocks – Sunflowerseed Oil

MY 2026/27 sunflowerseed oil stocks are forecast to decrease slightly from the previous year to 128,000 MT. In recent years, due to internal economic conditions, the private sector has generally preferred to hold smaller inventories of sunflowerseed oil.

Production – Soybean Oil

MY 2026/27 soybean oil production is projected to increase by 5 percent year-to-year to 570,000 MT, assuming Türkiye will import more soybeans for crushing.

The MY 2025/26 soybean oil production estimate is adjusted higher to 542,000 MT, based on strong crush demand.

Consumption – Soybean Oil

MY 2026/27 soybean oil consumption is expected to remain steady year-over-year at 47,000 MT. This figure would likely be higher given rising soybean imports, but the country's Biosafety Law prohibits vegetable oil made from genetically engineered (GE) soybeans to be used in food items. Soy oil made from imported GE soybeans will continue to be exported, used in livestock feed to improve feed efficiency, or used to make ink or paint.

Only soy oil from domestic soybeans can be used for making biodiesel. About 15,000 MT of soybean oil is used in biodiesel production each year. This amount has remained steady for years.

Trade – Soybean Oil

Imports

Türkiye imports negligible amounts of soybean oil.

Exports

MY 2026/27 soybean oil exports are forecast slightly higher year-over-year at 522,000 MT, assuming steady crush demand and rising soybean imports.

The MY 2025/26 soybean oil export estimate is adjusted higher to 500,000 MT, up from the prior year due to better profit margins than expected from the export business. For the first three months (Oct-Dec) of MY 2025/26, soybean oil exports increased 30 percent year-on-year to nearly 95,000 MT. Leading destinations were Algeria (35,000 MT), Spain (11,000 MT) and Tunisia (9,000 MT).

Stocks

MY 2026/27 soybean oil stocks are forecast slightly higher than the revised previous year's estimate at 11,000 MT.

OFFICIAL DATA CAN BE ACCESSED AT: PSD Online Advanced Query						

Production – Cottonseed Oil

MY 2026/27 cottonseed oil production is forecast at 126,000 MT, down year-over-year by nearly 9 percent because of the projected decrease in domestic cottonseed production. The MY 2025/26 cottonseed oil production estimate is adjusted lower year-to-year to 138,000 MT, based on a contraction in cottonseed production and a lower extraction rate. Post adjusted the extraction rate from 0.18 to 0.14 based on the latest information from sectoral contacts.

Consumption – Cottonseed Oil

MY 2026/27 cottonseed oil consumption is forecast at 127,000 MT, down year-over-year by nearly 10 percent in parallel with the expected contraction in cottonseed oil production.

The MY 2025/26 cottonseed oil consumption estimate is adjusted lower to 139,000 MT, based on the newly revised cottonseed oil production figure. Cottonseed oil is mainly used for making margarine, while small amounts are also used for industrial purposes. In years when cottonseed oil is in short supply, the food industry uses other alternative oils such as palm, sunflower, soybean, and canola oils.

Trade – Cottonseed Oil

Import

MY 2026/27 cottonseed oil exports are forecast unchanged from the prior year at 3,000 MT. Azerbaijan has dominated almost all trade in recent years.

Exports

MY 2026/27 cottonseed oil exports are forecast unchanged from the prior year at 2,000 MT.

MY 2025/26 cottonseed oil exports are revised down to 2,000 MT. Cottonseed oil exports during the first three months (Oct-Dec) of MY 2025/26 were about 430 MT, which is down 5 percent during the same period the previous year.

Stocks – Cottonseed Oil

MY 2026/27 cottonseed oil stocks are forecast to remain unchanged year-on-year at 15,000 MT, which mirror historical averages.

Production – Olive Oil

Olive oil production in MY 2026/27 is forecast to increase year-to-year by almost 90 percent to 400,000 MT. This anticipated increase in production is in line with the cyclical nature of olive production with one year an on-year and the next an on-year in terms of yields. The primary olive growing regions in the North Aegean and Southeast Anatolia have received a significant amount of rain compared to the previous year which will contribute to higher yields in the on-year production cycle. In the meantime, olive growers have already started fertilizing and pruning trees in preparation for the MY 2026/27 crop.

MY 2025/26 olive oil production is estimated lower year-to-year to 210,000 MT, based on the latest olive crop harvest reports for what was considered an “off year”. In addition, the dry weather conditions also had a negative impact on yields with some reports of withered fruit on olive trees.

Olive growers are continuing to invest in improvements to increase their yields. They are installing drip irrigation systems to conserve scarce water resources. Although olive trees are generally drought-

tolerant, they still require regular watering, especially when they are young or bearing fruit. Farmers are also adopting modern harvesting methods, such as handheld harvest machines, to minimize damage to the fruit and reduce losses.

The Turkish government continues to offer incentives to encourage farmers to grow more olive trees and establish new orchards. Due to these incentives and the profitability of the olive oil industry, the number of olive trees has grown over the last decade, reaching 190 million in MY 2024/25, according to TUIK data. Of those trees, 155 million were fruit-bearing trees. This number is expected to steadily increase in the coming years, contributing to higher olive oil production. Olive trees are primarily cultivated along the Aegean and Mediterranean coasts, as well as in the southeastern Anatolia region.

Consumption – Olive Oil

MY 2026/27 olive oil consumption is expected to increase year-to-year by about 100,000 MT to 320,000 MT, based on the on-year cyclical upturn in olive production. This prediction assumes that the price difference between olive oil and other vegetable oils will not discourage olive oil consumption.

MY 2025/26 olive oil consumption is estimated lower year-to-year to 220,000 MT, due to the expected contraction in domestic olive oil production. However, consumption is still a little higher than expected this year because of higher-than-expected carry-over stocks.

As of February 2026, the price for extra virgin olive oil retailed for between 300-400 TL per liter (\$7-9/Liter). According to information obtained from the sector, this year has seen an increase in consumer complaints about quality due to the large amount of carryover stocks from last year and the difficulty of storing olive oil under appropriate conditions.

Consumers consider olive oil to be a superior cooking oil. Over the years, domestic olive oil consumption has increased, especially among health-conscious city dwellers who typically have more disposable income. For most low- and middle-income consumers, however, olive oil consumption is largely influenced by the prices of cheaper alternatives, such as sunflower oil and butter. Currently, olive oil prices are about four times higher than those of sunflower oil, the most widely consumed vegetable oil in Turkey. Due to the price difference, olive oil is often adulterated with cheaper vegetable oils and sold as "olive oil" at a more affordable price in the local market.

Trade – Olive Oil

Exports

Olive oil exports in MY 2026/27 are projected to increase to 90,000 MT, paralleling the anticipated increase in domestic olive oil production.

The olive oil export forecast for the MY 2025/26 has been revised down to 50,000 MT, based on trade performance to date that has been depressed because Turkish olive oil is currently more expensive than olive oil from Europe and Tunisia. These pricing dynamics are expected to persist through the remainder of the marketing year.

Olive oil exports in the first two months of the 2025/26 MY (November-December) totaled 7,600 MT, a decrease of approximately 65 percent compared to the same period last year. The main export destinations were the United States (1,300 MT), Jordan (1,000 MT), and Canada (650 MT).

Imports

MY 2026/27 olive oil imports are expected to remain unchanged from the previous year at 5,000 MT. This forecast assumes minimal imports from Syria, formerly the largest supplier of olive oil to Turkiye, as Syrian traders prefer to sell their oil inside their own country since it's considered more profitable.

MY 2025/26 olive oil imports are slashed lower year-to-year to 5,000 MT, assuming the continued downturn in imports from Syria will continue throughout the year. Turkish sources report that Syrian olive oil traders prefer to sell their oil inside of Syria rather than exporting it to Turkiye like they've done in the past. Olive oil imports during the first two months (Nov-Dec) of MY 2025/26 totaled about 2,000 MT, nearly all of which came from Syria and Tunisia.

Stocks – Olive Oil

Olive oil stocks for MY2026/27 are expected to slightly decrease year-to-year to 100,000 MT, due to higher domestic consumption in the new harvest year and a reduction in stocks remaining from previous years.

MY2025/26 stocks are estimated higher than originally expected at 105,000 MT in part because of depressed export volumes.

Annex

Table 5: Oilseed, Meal, and Oil Tariffs for Calendar Year 2026

HTS	Product	Tariff Rate		
1201	Soybeans	0%		
120729	Cottonseed	10%
