Date: November 21, 2025

Report Number: BR2025-0045

Report Name: Oilseeds and Products Update

Country: Brazil

Post: Brasilia

Report Category: Oilseeds and Products

Prepared By: Samuel Dantas dos Santos

Approved By: Frederick Giles

Report Highlights:

Brazil's soybean sector continues to demonstrate strong momentum, with MY 2024/25 production reaching a new record driven by higher yields—particularly in São Paulo, Goiás, and the MATOPIBA region—supported by favorable weather and improved cultivation practices. Although heavy rains and unstable climate conditions in early November temporarily slowed planting in key states, sowing activities quickly regained pace across major producing regions. Production costs remain under pressure due to high interest rates, though seed and fertilizer prices have eased slightly. Soybean oil and meal output are also increasing, supported by the new B15 biodiesel mandate, which is driving greater crushing volumes and boosting domestic consumption.

BRAZIL'S SOYBEAN AREA, PRODUCTION AND YIELD ESTIMATES (MY 2024/25)

Area

Post maintains its most recent Marketing Year (MY) 2024/25 area estimate at 47.6 million hectares (ha). This expansion represents a total increase of three percent compared to the USDA official number of 46.1 million ha for MY 2023/24.

The most significant increase in total cultivation area in Brazil was observed in the Center-West region, with nearly 400 thousand ha occurring in the state of Mato Grosso alone. The MATOPIBA region—which includes the states of Maranhão, Tocantins, Piauí, and Bahia—also recorded a notable expansion in production area, with Bahia reporting a 9.5 percent increase. Overall, the total expansion in the MATOPIBA region for MY 2024/25 surpassed that of Mato Grosso, reaching approximately 460 thousand ha.

Production

With the total harvest reportedly completed during the first week of September, Post revises its MY 2024/25 total production estimate to 171 million metric tons (MMT), a new record for Brazilian soybean production. This figure represents an increase of less than one percent from the previous estimate for the current marketing year, but nearly 11 percent higher than MY 2023/24, when total production reached 154.5 MMT.

This recent revision in production is based on a combination of factors, including a significant increase in productivity reported in the southeast region of Brazil, especially in the state of São Paulo.

Yield

Favorable weather conditions across most regions of Brazil during the first half of 2025 contributed to a recovery in productivity, resulting in a 7.3 percent increase in yield compared to 2024. This performance led to a revised average yield of 3.59 metric tons per hectare (mt/ha) for MY 2024/25, marking a new record for soybean productivity in Brazil.

In 2025, the state of São Paulo registered the largest recovery in productivity, with an average yield of 3.89 mt/ha—8 percent above the national average of 3.59 mt/ha—according to data from the Companhia Nacional de Abastecimento (Conab). This represents a nearly 40 percent increase from the previous year, when the state's average yield was reported at 2.80 mt/ha for MY 2023/24. Sector specialists attribute this strong recovery primarily to more favorable climatic conditions in the state.

Figure 1

National and Regional Average Soybeans Production, Area Planted and Yield for MY 2024/25

Source: Brazilian National Supply Company (CONAB) and Post Brasilia (Office of Agricultural Affairs – OAA). Chart generated by Post Brasilia (Office of Agricultural Affairs – OAA).

Other notable production performances were reported in the state of Goiás, which recorded the highest average yield in the country at 4.18 mt/ha, followed by the states of Bahia, Mato Grosso, Minas Gerais, Santa Catarina, and São Paulo, with a combined average yield of 4.02 mt/ha. This outcome reflects more stable climatic conditions, greater investments in infrastructure, and advancements in technology and cultivation practices compared to other producing regions.

MY 2025/26 Planting Progress Slows After a Strong Start in Key Regions Due to Weather Conditions.

As of the third week of November 2025, nearly 80 percent of the regions subject to the “Vazio Sanitário” (Sanitary Void) period in Brazil are now authorized to begin soybean planting for the MY 2025/26 season, marking the start of a new and promising production cycle.

The Sanitary Void is a mandatory period when farmers are prohibited from planting or having soybean plants in their fields. Its main purpose is to interrupt the life cycle of pests and diseases, especially Asian soybean rust.

Brazil started this year’s sowing season with great progress being reported in key regions of the country. As of October 17, 2025, nearly 25 percent of the total area projected for MY 2025/26 had already been planted, representing a 21-percent increase compared to the same period last year, when only 20.5 percent of the soybean area was sown.

However, despite this strong start, heavy rains and unstable weather conditions in several states between the last week of October and the first week of November slowed planting activities and affected areas already cultivated. Paraná and Goiás were among the states most significantly affected, causing Brazil to record its lowest planting progress for this period in the first half of November in the past five years.

Figure 2
Brazil Soybean Sowing Progress (MY 2025/26)

Source: Instituto Mato-Grossense de Economia Agropecuária (IMEA) and Post Brasília (Office of Agricultural Affairs – OAA).

More recently, planting activities have resumed and stabilized, with the fastest progress reported in Mato Grosso (96 percent), São Paulo (95 percent), Paraná (93 percent), and Mato Grosso do Sul (91 percent)—states that ended their Sanitary Void period in early September, ahead of most others. These regions also benefited from early rainfall, which supported the initial planting stages.

The states of Bahia and Tocantins, although still in the early to mid-stages of planting with an average progress of about 55 percent, have also shown notable improvements compared to the same period in previous years.

BRAZIL'S SOYBEAN AREA, PRODUCTION AND YIELD ESTIMATES (MY 2025/26)

Area

Post forecasts that soybean planted area for MY 2025/26 will increase by 3 percent compared to MY 2024/25, reaching a total of 49.1 million ha. Most of this expansion is expected to occur in the states of Mato Grosso, Mato Grosso do Sul, Goiás, Rio Grande do Sul, Paraná, and the MATOPIBA region (Maranhão, Tocantins, Piauí, and Bahia).

Figure 4

Evolution of Soybean Area, Production and Yield in Brazil (MY 2009/10 – MY 2025/26)*

Source: FAS. Chart generated by Post Brasilia (Office of Agricultural Affairs – OAA). Note: Data for the latest MY, marked with (*), considers Post's estimates and forecasts.

The expansion in total soybean plantings is driven by multiple factors. These include a potential end or greater flexibility in the Soy Moratorium, which would reduce restrictions on certain areas, as well as the recent increase in demand for Brazilian soybeans, particularly from the People's Republic of China (PRC), which has reportedly reduced soybean imports from the United States and redirected purchases toward Brazil.

In addition, in early August, the Government of Brazil implemented the new B15 biofuel mandate, which increased demand for soybean crushing and further incentivizing producers to expand plantings across the country.

Production

Post forecasts total production for MY 2025/26 to reach 177 MMT, marking another record harvest. The increase is driven by a 3.1 percent expansion in planted area, significant progress in early planting stages, and anticipated favorable weather conditions for the upcoming year.

This new record represents a 3.5 percent increase compared to MY 2024/25, when total production was reported at 171 MMT.

Yield

Early precipitation in most key producing states has supported soybean sowing in the initial stages, along with expectations of favorable weather throughout MY 2025/26. These factors indicate high yield potential, with the national average yield forecast at 3.60 mt/ha.

Sector specialists have noted a potential decline in production in Mato Grosso—Brazil's largest soybean-producing state—mainly due to reduced investment stemming from uncertainty surrounding production costs, low future prices, high interest rates, and commercialization challenges.

However, a recovery in productivity in key states such as Rio Grande do Sul—which has been significantly affected by unstable weather in recent years—is anticipated and expected to more than offset any potential decline in Mato Grosso.

Cost of Production

Soybean direct production costs slightly decreased in September 2025 compared to the consolidated figures from the previous year.

According to data published by Instituto Mato-Grossense de Economia Agropecuária (IMEA), the average production cost per hectare of soybeans in September was BRL 4,173.67, a 1.76 percent decline from the BRL 4,248.63 reported for MY 2024/25. The reduction was mainly driven by lower seed and fertilizer costs.

Figure 5
Cost of Soybean Production in Mato Grosso

Source: Instituto Mato-Grossense de Economia Agropecuária (IMEA) | Chart generated by Post Brasília (Office of Agricultural Affairs – OAA).

However, when considering the total cost of production, there was a 4.4 percent increase in September 2025 compared to the consolidated figure for 2024, which was reported at BRL 7,895.60. This rise in total production costs can be attributed to a higher overall opportunity cost, driven by increased interest rates and rising land prices.

The increase in domestic interest rates—from 10.75 percent to 15 percent annually over the past year—has significantly raised financing costs, making it more challenging and expensive for producers to refinance debt or maintain operations.

Figure 6

Historical Basic Interest Rate (February 2024 – September 2025 Selic % a.a.)

Source: Brazilian Central Bank | Chart generated by Post Brasilia (Office of Agricultural Affairs – OAA).

Government Investment (Plano Safra)

In late June and early July 2025, the Government of Brazil launched the Plano Safra 2025/2026, allocating BRL 89 billion to support family farming and BRL 516.2 billion for commercial agribusiness (medium and large producers). These allocations represent a 17 percent increase for family farming and a 29 percent increase for commercial agribusiness compared to the previous cycle, which offered approximately BRL 76 billion and BRL 400 billion in credit lines, respectively. The plan aims to strengthen Brazil's agricultural sector by expanding access to rural credit, promoting food security, and supporting sustainable production and modernization.

Under the Pronaf component of the program, family farmers receive subsidized interest rates ranging from 2 to 5 percent, along with access to technical assistance, crop insurance, and public purchase programs. Medium and large producers have access to market-linked interest rates, generally between 10 and 14 percent, depending on the credit line, for operating costs, investments, and commercialization. Both categories are eligible for a 0.5 percentage point reduction when adopting sustainable practices under programs such as [ABC+](#). While the family farming plan prioritizes inclusion and resilience, the agribusiness component focuses on productivity, modernization, and export competitiveness—together forming a comprehensive financing strategy for Brazil's agricultural sector.

However, key industry representatives have expressed dissatisfaction with the plan, describing it as insufficient to meet the sector's needs and inadequate given the current economic challenges faced by

soybean producers. One of the main concerns is the increase in interest rates, with medium-sized producers facing rates of up to 10 percent per year and large producers up to 14 percent, compared to previous levels of 8 percent and 12 percent, respectively.

In addition, a 32 percent reduction in funds for interest rate equalization, from BRL 5.6 billion to BRL 3.9 billion, and a 42 percent cut in the Rural Insurance budget, from BRL 1.06 billion to BRL 445 million, could lead to reduced investments and lower productivity.

Prices

After the price increases reported in early October in Brazil, soybean prices declined again, largely pressured by lower futures on the Chicago Board of Trade (CBOT). According to data from the Center for Advanced Studies on Applied Economics (CEPEA), prices fell in 22 of the 38 monitored regions, while only a few areas—mainly in Mato Grosso do Sul—registered slight increases.

Figure 7
Soybean Prices at the Port of Paranaguá in 2015-2025

Source: CEPEA data | Chart generated by Post Brasilia (Office of Agricultural Affairs – OAA).

In Paranaguá, during the second week of September, soybean prices peaked at USD 26.48 per 60-kg sack. For October overall, prices have declined by approximately 2.56 percent, with an average price of USD 25.80 per 60-kg sack so far.

The drop in domestic prices is primarily linked to weaker demand in Chicago, although continued Chinese demand for Brazilian soybeans and higher export premiums may help stabilize prices.

Environmental Licensing Reform and The Suspension of The Soy Moratorium

Two topics that have recently gained significant attention and have the potential to shape the future of Brazil's soybean sector are the environmental licensing reform and the suspension of the Soy Moratorium.

After years of debate and legal disputes surrounding the Soy Moratorium, in August 2025, Brazil's Administrative Council for Economic Defense (CADE) decided to suspend the moratorium, effective January 2026, ending nearly two decades of implementation and creating uncertainty about the future of the agreement.

A Supreme Federal Court (STF) ruling is still pending regarding Mato Grosso State Law No. 12,709/2024, which prohibits granting tax incentives or donating public land to companies that participate in Soy Moratorium agreements.

With the suspension in place, public and private stakeholders now face a period of discussion and adjustment. Given the uncertainties surrounding the agreement, the soy sector is reportedly shifting toward private sustainability certifications, such as the Round Table on Responsible Soy (RTRS) and the International Sustainability and Carbon Certification (ISCC), a move largely driven by international market requirements, including the upcoming European Union Deforestation Regulation (EUDR).

The main challenge ahead lies in developing inclusive and credible mechanisms that promote transparency, competitiveness, and socio-environmental integrity for Brazilian soybeans. While this suspension could present new opportunities and potential expansion for Brazil's soybean industry, it may also pose significant risks to the commodity's international marketability.

Additional details on the Brazilian Soy Moratorium can be found in the recently posted GAIN reports: [Brazil's Soy Moratorium - Balancing Economic Interests and Regulatory Measures | BR2025-0016](#) and the [Update on Legal Challenges Surrounding the Soy Moratorium in Brazil - Market Risks and International Pressure_Brasilia_Brazil_BR2025-0036](#)

Alongside the suspension of the Soy Moratorium, another development that could significantly impact the soybean sector is the approval of the General Environmental Licensing Law (PL 2.159/2021). This legislation establishes a nationwide framework for standardizing procedures and deadlines related to environmental permits.

The bill seeks to streamline and unify Brazil's environmental licensing process, potentially unlocking key infrastructure projects—such as roads, warehouses, ethanol plants, and the [Ferrogrão](#) railway—which could save billions in freight costs and enhance competitiveness. The measure also simplifies

licensing for renewable energy projects, including solar and wind, thereby reducing energy costs for farmers.

Overall, the agricultural sector views the reform as a positive step toward reducing bureaucracy, improving infrastructure, and strengthening legal and environmental security. However, experts caution that the measure could harm Brazil’s international reputation and trade relations, particularly with markets that demand strong environmental safeguards and compliance.

Trade

According to data from the Brazilian Department of Foreign Trade (Secex), between January and September 2025, Brazil exported nearly 94 MMT of soybeans, representing an increase of 4.83 percent compared to the same period in 2024. In September alone, exports totaled 7.34 MMT, a historic record for the month. This performance was driven by strong Chinese demand, as the country has increasingly concentrated its purchases among South American suppliers.

Post estimates that by the end of MY 2024/25, Brazil will have exported approximately 109 MMT of soybeans, an increase of 10.3 percent compared to the previous season. Most of this growth in exports is expected to be destined for the People’s Republic of China (PRC), where Brazil—between January and September—has already increased its shipments by 11 percent compared to the same period in 2024.

Figure 8
Brazil Soybeans Exports to China | 2024 – 2025 Comparison

Source: SECEX - Trade Data Monitor (TDM) | Chart generated by Post Brasilia (Office of Agricultural Affairs – OAA).

Post forecasts Brazil's soybean exports to reach 113 MMT in MY 2025/26, representing a 3.7 percent increase compared to MY 2024/25.

Ongoing judicial disputes in Brazil related to environmental issues, such as the future of the Soy Moratorium, could potentially harm Brazil's sustainability reputation and hinder the projected growth in soybean exports—particularly to the European Union. However, much of the expected increase in exports continues to be driven by strong trade relations with the People's Republic of China (PRC) and the current global trade dynamics involving the United States.

Further details on how Brazil has consolidated its position as the leading supplier of soybeans to the PRC can be found in the following GAIN report: [Assessment of Soy China Initiative in Brazil](#).

Soybean Oil

Post forecasts Brazil's soybean oil production for MY 2025/26 at 12.3 MMT, representing a 4.1 percent increase compared to MY 2024/25, for which post maintains an estimate of 11.8 MMT.

The projected increase for MY 2025/26 is primarily driven by the recent rise in the mandatory biodiesel blend from B14 to B15, which took effect in August 2025, with a potential further increase to B16 beginning in March 2026. This shift is expected to boost domestic demand for soybean oil, generating optimism among producers and processors.

Soybean oil accounts for approximately 75 percent of Brazil's biodiesel production. According to Post contacts in the sector, the new B15 mandate is expected to result in more than 7 MMT of soybean oil being processed for biodiesel—an increase of 9.3 percent compared to soybean oil consumption for this segment in 2024.

Although September recorded the lowest level of soybean oil exports for the month since 2020, Brazil has already exported 1.26 MMT between January and October 2025, a 9.6 percent increase compared to the same period in 2024, when exports totaled 1.15 MMT.

India remains the main destination for Brazilian soybean oil, accounting for nearly 60 percent of total exports so far in 2025.

Figure 9

Monthly Brazilian Soy Oil Exports (January 2020 – September 2025)

Source: SECEX - Trade Data Monitor (TDM) | Chart generated by Post Brasilia (Office of Agricultural Affairs – OAA).

Soybean Meal

Post revises up Brazil's soybean meal production for MY 2024/25 to 44.6 MMT, primarily due to increased soybean processing for biofuel purposes following the implementation of the new B15 mandate.

For MY 2025/26, Brazil's soybean crush is projected to yield 46.1 MMT of soybean meal. With biodiesel producers expected to consume at least an additional 600 thousand metric tons of soybean oil as a result of the new mandate, crushing plants are anticipated to process up to two million additional tons of soybeans, potentially generating an extra 1.4 MMT of soybean meal.

Nearly 52 percent of Brazil's total soybean meal production is expected to be destined for exports. In 2024, Brazil exported more than 23.1 MMT of soybean meal, with 19.4 MMT being exported between January and October of that year. In 2025, exports have already exceeded 19.6 MMT, a one percent increase compared to the same period last year. Indonesia remains the leading destination, followed by Thailand and Europe, consistent with historical trade patterns.
