

Market Monitor

No.18 – May 2014

www.amis-outlook.org

*The **Market Monitor** is a product of the [Agricultural Market Information System \(AMIS\)](#). It covers the international markets for wheat, maize, rice and soybeans, giving a synopsis of major market developments and the policy and other market drivers behind them. The analysis is a collective assessment of the market situation and outlook by the ten international organizations that form the AMIS Secretariat. Ultimately, the report aims at improving market transparency and detecting emerging problems that might warrant the attention of policy makers.*

World Supply-Demand Outlook

The early outlook for major cereals points to a relatively stable supply in 2014/15 despite rising consumption. However, weather uncertainty and tensions in the Black Sea region dampen the generally favourable outlook. In addition, with increasing chances of El Niño hampering cultivations in the critical growing months ahead, markets could become more volatile.

From previous season	
Wheat	■
Maize	▼
Rice	■
Soybeans	▲
▲ Easing ■ Neutral ▼ Tightening	

For wheat, maize and rice, previous season refers to 2013/14. For soybeans, previous season refers to 2012/13.

	million tonnes

Trade	137	161	151	144	150	150
Ending Stocks	177	187	190	187	178	180

- **Wheat** production in 2014 to decline by 2 percent from last year's record harvest with most of the reduction in Canada.
- Utilization in 2014/15 to increase for the first time since 2011/12 on stronger feed use, especially in the EU.
- Trade in 2014/15 to remain close to the record volume in 2013/14, sustained by continued strong import demand in Asia.
- Stocks (ending in 2015) up slightly from their opening levels, but exportable supplies tighten on lower inventories in Canada, Ukraine and the US.

Trade	95	119	113	112	113	110
Ending Stocks	134	158	158	163	170	162

- **Maize** production in 2014 to decline by 4 percent from the 2013 record, mostly on lower output in the US driven by reduced plantings.
- Utilization in 2014/15 to expand at a slower pace than in 2013/14 but exceeding the 10-year trend for the second consecutive season mainly on strong growth in China.
- Trade in 2014/15 to fall below the record in 2013/14, reflecting the expectation of smaller imports by the EU given the prospect of large wheat supplies.
- Stocks (ending in 2015) to decline by 4 percent with the bulk of the anticipated decrease in China and in the US.

Trade	39	41	38	39	39	39
Ending Stocks	110	111	110	111	181	180

- **Rice** production forecast portending a below trend growth for the second consecutive year, at 1 percent.
- Utilization set to expand by 2 percent. Per capita food consumption to rise by 2 percent.
- Trade in 2014 rising to a new record, as falling world prices foster a return of large importers. Preliminary prospects for trade in 2015 suggest little change.
- Stocks (ending in 2015) to contract modestly, for the first time in ten years.

Ending Stocks	58	69	26	27	28	29	30

- **Soybeans** 2013/14 production forecast raised slightly on account of an upward revision in Brazil. Global output set to reach an all-time-record, though falling short of earlier expectations.
- Utilization forecast for 2013/14 unchanged, as downward revisions in US and Argentina are compensated by higher estimates elsewhere.
- Trade forecast raised to new record on higher US exports, destined to the EU, China and other Asia; interestingly, US imports could also be record-high.
- Stock forecast (2013/14 carry-out) adjusted upwards, confirming y/y recovery in global inventories at around 10 percent.

All totals (world estimates and forecasts) shown are computed from unrounded data. All changes, in absolute or percentage terms, are also calculated based on unrounded figures and accordingly reported in the supply/demand commentaries. Analysis presented in this report is largely based on information as of late April 2014. **Explanatory notes** and list of **sources** are available at the end of the report.

Crop Monitor*

Crop Conditions in AMIS countries (as of April 28th)

Crop condition map synthesizing information for all four AMIS crops as of April 28th. Crop conditions over the main growing areas for wheat, maize, rice, and soybean are based on a combination of national and regional crop analyst inputs along with earth observation data. **Crops that are in other than favourable conditions are displayed on the map with their crop symbol.**

Highlights

Wheat- Overall growing conditions are mostly favourable in the northern hemisphere, and in many western regions development is ahead of average due to warm temperatures. However, concern continues in the US southern plains due to persistent dry conditions. In both US and Canada there are delays due to the cold winter and spring.

Rice- Conditions are mixed. Production prospects are below average in Vietnam and Thailand, and are average in Indonesia. In China, conditions are good for the early-planted rice crop. In Brazil, harvest is complete and prospects are good. In EU planting is ongoing and conditions are favourable.

Maize- Overall conditions are favourable. In the southern hemisphere, the season is coming to a close. In Argentina, conditions are favourable and in Brazil, production is decreased due to reduced planted area. In the northern hemisphere, the season has started, and so far conditions are generally favourable.

Soybeans- Overall prospects are favourable. In Argentina, conditions are still good as the season draws to a close. In Brazil, despite the climatic adversity during the season, prospects are above average due to increased planted area.

El Niño situation update

As noted in the April report, there are prospects for development of El Niño conditions in late summer or autumn of the northern hemisphere. April outlooks (from the World Meteorological Organization, the International Research Institute for Climate and Society, the U.S. National Oceanic and Atmospheric Administration, and The Australian Bureau of Meteorology) continue to indicate this possibility, with the probability of occurrence rising above 60%, an increase since last month. Though neutral conditions continue to prevail, March and April saw ocean warming that characteristically precedes El Niño.

*Crop Monitor is developed for AMIS by GEOGLAM. It summarizes latest conditions for AMIS crops based on regional expertise and analysis of satellite data, ground observations, and meteorological data.

Wheat: In the northern hemisphere, winter wheat conditions are favourable. In **Russia**, conditions are mostly good and winter wheat development is between 1 to 2 weeks ahead of average. In central growing areas, warm and dry conditions developed in mid April and precipitation is needed in coming weeks. In **Ukraine**, conditions are generally good. Crop development is ahead of average due to the warmer than usual weather. Following a precipitation deficit, April rains and favourable temperatures supported crop development in the majority of the country. Moisture remains low in parts of the country and precipitation is needed in coming weeks. In the **EU**, prospects are generally favourable, and close to 2013. Warmer-than-usual weather continued, leading to advanced vegetative development. The dryer spring compensated for the very wet winter and was favourable for fieldwork and sowing of spring wheat, with the exception of Ireland and Scotland. Poland, the Baltic countries, Romania, Bulgaria, Spain and Italy have very favourable conditions. In contrast, rainfall scarcity is an emerging concern in eastern France and the Benelux. In **Canada**, conditions are still favourable, however continued below-normal temperatures, and precipitation in April delayed and attenuated the annual spring snowmelt, which resulted in some flooding and delays in spring wheat seeding. Delays range from 3 weeks to less than a week. Areas of low soil moisture persist in southern Alberta and Saskatchewan, and developed in southern Ontario. In the **US**, winter wheat conditions are mixed, and planted area is slightly down relative to last season. Drought in the Southern Great Plains continues to be a significant concern. Other winter wheat growing areas have closer to normal conditions, and spring wheat planting has started. In **Mexico**, the crop is in the maturity stage, and a good harvest is expected across the country. Decreased production is expected in the northwestern region due to the strong March winds and lack of cool temperatures. In **India**, wheat harvest is progressing, and very good prospects are expected. In **China**, conditions are generally favourable for the reproductive to maturing winter wheat. Widespread rainfall maintained good moisture conditions in the majority of growing regions. Pockets of dryness remain in north-eastern, southern and central regions in South West China. Development is ahead of normal by 1 to 2 weeks. In **Brazil**, wheat planting started in the major producing states and will continue through June. Area is expected to increase as a result of good market prices. In **Australia**, planting has started in Queensland and conditions are favourable.

Wheat Condition for AMIS countries as of April 28th.

For detailed description of pie chart please see box on page 4.

Rice Condition for AMIS countries as of April 28th.

For detailed description of pie chart please see box on page 4.

harvest has also been delayed. In **China**, conditions are generally good. Recent precipitation boosted moisture supplies for the early crop particularly in central and southern growing regions. In **Brazil**, prospects are good. Harvest is complete, and production is higher relative to last year due to the increase in planted area and favourable weather. In the **EU**, field preparation and sowing is on-going with favourable conditions in southern Europe (Spain, Italy, Greece, France).

Rice: Conditions are mixed. In **Indonesia**, conditions are close to average for the winter planted crops, which are in the reproductive to harvesting stages. Moderate April rainfall is supporting development in most regions. In **Vietnam**, prospects for the fall-winter rice are lower than last year due primarily to lower sown area and delayed harvest, which are a result of floods in January and cooler than usual weather. April was the last month for sowing paddy rice for the winter-spring season, and area sown is below last years' area. In **Thailand**, prospects remain below average for the second rice crop, primarily due to the cold weather in the beginning of the year as well as due to dry conditions in parts of the country. As a result,

Maize: In the southern hemisphere, conditions are variable. In **Argentina**, overall conditions are still good and the crop is in grain filling to harvest phases. In **Brazil**, the second maize crop is mostly in the flowering to grain filling phases. Accounting for both the first and second crops, a decrease in production is expected in large part owing to reduced planted area. In **South Africa**, conditions during the austral summer were favourable over most of the growing areas. A late start to the season as well as a dry spell during January had a slight negative impact over the western half of the production area. An extended midsummer dry period also had a small negative impact over eastern growing regions. Nonetheless, a normal to above-normal yield is expected. In the northern hemisphere, conditions are favourable. In **Mexico**, conditions are favourable across the country. Harvest from the autumn-winter crop is good though there is still some concern over the northeast growing region due to the impact of the strong March winds. Planting of the spring-summer crop began in April (rainy season). In the **US**, planting is just getting started. The cool and wet spring is delaying sowing in much of the country. If planting is delayed significantly, there could be a yield reduction or a switch to later season crops like soybeans. In the Southern Great Plains, there is the opposite concern over dryness. However, this area provides a relatively small percentage of the US corn production. In the **EU**, maize is in sowing to early development stages with overall normal conditions. In **China**, overall conditions are favourable, however there is some concern in the southern tip of the spring maize area, which suffered excessive precipitation that is affecting development.

Maize Condition for AMIS countries as of April 28th.

For detailed description of pie chart please see box below.

Soy Condition for AMIS countries as of April 28th

For detailed description of pie chart please see box below.

Soybeans: In the southern hemisphere, prospect are favourable. In **Argentina**, overall conditions for both the first and second planted crops are still good. Harvest of the first crop continues with a delay relative to the previous season, and over half of the second planted crop is in the maturity stage. In **Brazil**, harvest is almost complete. Despite the climatic adversity this growing season, the total production increased due to the increase in area planted. In **South Africa**, conditions during austral summer were favourable across all production areas. In **Australia**, conditions are mixed for the maturing crop. Hot dry conditions are likely to limit production in Queensland however in New South Wales conditions are favourable as March and April rainfall has likely improved yield

potential in this area. In the **EU**, soy is in sowing to early development stages with overall favourable conditions.

Pie chart description: A country's slice of the pie chart is representative its portion of the 5 year average of the total AMIS countries' production for each crop. The producers responsible for 90% of production are individually shown, with the remaining 10% producers grouped into the "Other AMIS Countries" category. The area within each country's pie slice is divided between crops in-season (colour) and out-of-season (gray). The in-season portion is coloured according to the various crop conditions within that country. When conditions are labeled as 'poor' or 'watch', icons are added that provide information on the key climatic drivers affecting conditions. The crop calendar, condition and climatic driver information are based on inputs provided by the crop monitor analysts on a sub-national division basis, and therefore reflect conditions by area rather than overall national production.

Sources and Disclaimers: The Crop Monitor assessment has been conducted by GEOGLAM with inputs from the following partners (in alphabetical order): Argentina (INTA), Asia Rice Countries (AFSIS, ASEAN+3 & Asia RiCE), Australia (ABARES & CSIRO), Brazil (CONAB & INPE), Canada (AAFC), China (CAS), EU (EC JRC MARS), India (ISRO), Indonesia (LAPAN & MOA), International (CIMMYT & FAO & IRRI), Japan (JAXA), Mexico (SIAP), Russia (IKI), South Africa (ARC & GeoTerraImage & SANSA), Thailand (GISTDA & OAE), Ukraine (NASU-NSAU & UHMC), USA (NASA, UMD, USDA (FAS, NASS, ARS)), Vietnam (VAST & VIMHE-MARD). The findings and conclusions found in this joint multiple-agency reporting are only consensual statements from the GEOGLAM expert group, and do not necessarily reflect those of the individual agencies represented by these experts. Map data sources: Major crop type areas based on the IFPRI/IIASA SPAM 2005 beta release (2013), USDA/NASS 2013 CDL, 2013 AAFC Annual Crop Inventory Map, GLAM/UMD, GLAD/UMD, Australian Land Use and Management Classification (Version 7), SIAP, and JRC. Crop calendars based on GEOGLAM partner crop calendars and USDA crop calendars.

More detailed information on the GEOGLAM crop assessments is available: www.geoglam-crop-monitor.org.

International Prices

International Grains Council (IGC) Grains and Oilseeds Index (GOI) and GOI sub-Indices

	April 2014 Average*	% Change	
		M/M	Y/Y
GOI	266	+ 1.0%	- 3.5%
Wheat	246	+ 0.5%	- 5.1%
Maize	246	+ 1.1%	- 11.3%
Rice	177	- 1.0%	- 12.0%
Soybeans	277	+ 1.6%	+ 3.7%

*Jan 2000=100, derived from daily export quotations

Wheat: World wheat export prices were virtually unchanged in April. Generally comfortable nearby supplies and mostly favourable prospects for the 2014 harvest, particularly in the EU, were balanced by less than ideal crop conditions in certain areas, especially for US winter wheat, and sustained uncertainty about the impact of political tensions in the Black Sea region. After rising by 7 percent in March, the average IGC GOI wheat sub-Index edged up by less than 1 percent m/m in April.

Maize: World maize export prices maintained their firm tone during April, with support mainly stemming from brisk export demand and worries about the impact of the slow start to US spring planting on yield potential. The IGC GOI maize sub-Index averaged 1 percent higher m/m, but, with global supplies more comfortable than last season, prices remain 11 percent lower y/y.

Rice: Asian markets for white and parboiled rice were mixed during April. While prices fell in Thailand and Vietnam, due to ample export availabilities and soft international demand, local currency movements lifted dollar-denominated quotations in South Asia. The IGC GOI rice sub-Index averaged 1 percent lower m/m.

Soybeans: Soybean export prices mostly recorded modest net gains m/m, with the IGC GOI sub-Index increasing by 2 percent. Tightening old crop supplies provided underlying support in the US, but increases were capped by Chinese defaults on earlier purchases and the diversion of some of these shipments to the US. Export quotations were also slightly firmer in Brazil, led by higher futures despite the near-completion of harvesting, but those in Argentina were pressured lower by improved harvest weather.

Policy Developments

- **Biofuels:** taxes on biodiesel for domestic use will be reduced in **Argentina**. This move follows the increase of the government-set price in mid-March and the rise of the mandate mix in January and February. A panel was setup by the Dispute Settlement body of the WTO to resolve the EU-Argentina biodiesel dispute over anti-dumping measures imposed by the EU against Argentina.
- **Domestic measures:** The government of **Canada** introduced a joint agriculture and transport legislation with regards to rail capacity to transport grains. The legislation imposes quantitative transport targets to railways and foresees improved planning of grain movements, among other aspects. Consecutive auctions were held in **China** for the sale of wheat from state reserves. The subsidised food programme announced in **Egypt** will cover price discounts for bread. The volume of government procured wheat will be increased by 40% to 5 million tonnes. **India** announced plans to expand farmland under irrigation by 10% by 2017. Farmers in the Maharashtra, Madhya Pradesh, Karnataka and Rajasthan regions whose horticultural crops were damaged by rain and hail will receive compensation from the National Disaster Response Fund. In **Thailand**, the government initiated payments to farmers who pledged rice under the 2013/14 crop year. The payments will be partially funded by selling government rice stocks.
- **Trade measures:** the **EU** announced that starting end-April 2014 Ukraine will be offered duty-free tariff rate quotas for wheat, barley and maize. Several tenders were issued in **India** for exports of wheat. In **Indonesia** new rules will apply to imports and exports of rice, limiting imports to registered importers and varieties not grown domestically, and exports to periods of excess production. Government imports of rice will continue to be carried out for price stabilisation purposes. **Thailand** signed a Memorandum of Understanding with **the Philippines** for the supply of 3 million tonnes of rice. The Parliament of **Ukraine** will consider a draft law to apply a 15% export duty to soybeans.

Historical Volatility – 30 Days

	Monthly Averages		
	April 2014	March 2014	April 2013
Wheat (Nearby)	32.4%	30.2%	32.7%
Maize (May)	20.6%	17.7%	17.7%
Rice (Nearby)	13.9%	16.7%	19.5%
Soybeans(Nearby)	18.9%	17.0%	19.4%

Prices

Prices for maize and soybeans rose moderately m/m while prices for wheat and rice were negligibly higher. Maize prices were upheld by slow planting progress. The USDA reported 19 percent planting complete vs. 28 percent over a five-year average, raising concerns about further acreage shifts into soybeans, which are planted later. Nearby future contracts of soybean continue to be supported by high export and domestic demand and strong farmer holding. Wheat prices were most affected by the day-to-day developments in the Black Sea region and exhibited a choppy trading pattern. Dryness in the southern plains of the US also helped sustain wheat prices which are now close to last year's prices.

Volumes and Volatility

Volumes were higher m/m for wheat, maize and soybeans with maize exhibiting the greatest increase of 25%. Implied Volatility declined slightly for wheat and maize while rising somewhat in soybeans.

Forward curves

Forward curves showed only minor changes in configuration. Nearby maize continued to traded at levels similar to the December new crop price, despite a projected adequate ending stocks-to-use ratio - normally predictive of an upward sloping price configuration (contango). Soybean forward curves persist in a steep downslope (backwardation) due to projected tight ending stocks-to-use ratio, while wheat shows a fairly normal contango structure.

Investment flows

After initially reducing its net long positions in wheat, maize and soybeans, managed money reversed its sell strategy to a buy strategy at month end – thus preserving its same net long positions as previous month. Swaps dealers showed little activity for the month.

AMIS Market Indicators

Some of the indicators covered in this report are updated regularly on the AMIS website. These, as well as other market indicators, can be found at:

<http://www.amis-outlook.org/amis-monitoring/indicators/>

Explanatory Notes and Calendar

The notions of **tightening** and **easing** used in the summary table of “**World Supply and Demand**” reflect judgmental views which take into account market fundamentals, inter-alia price developments and short-term trends in demand and supply, especially changes in stocks.

All totals (aggregates) are computed from unrounded data. World supply and demand estimates/forecasts in this report are based on the latest data published by USDA, IGC and FAO. They may vary for many reasons, but mainly because of different methodologies and release dates.

FAO-AMIS: World estimates and forecasts are based on information received from AMIS countries as well as FAO data.

Dates: Refer to the release date of the data from the selected sources: FAO, IGC, and USDA.

Production: Cereal production data refer to the calendar year of the first year shown. Rice production is expressed in milled terms. Soybeans production data refer to the split (i.e. 2013/14) season.

Supply: Defined as production plus opening stocks.

Utilization: For wheat, maize and rice utilization includes food, feed and other uses (“other uses” comprise seeds, industrial utilization and post-harvest losses). For soybeans, it comprises crush, food and other uses.

Trade: Data refer to exports. For wheat and maize, trade is reported on a July/June marketing year basis, except for the USDA maize trade estimates, which are reported on an October/September basis. For rice, trade covers flows from January to December of the second year shown and for soybeans from October to September. Trade between European Union member states is excluded.

Ending Stocks: Data is calculated as the aggregate of carry-overs at the close of national crop seasons ending in the year shown.

AMIS Crop Calendar

* The percentages refer to the global share of production (average 2008-12).
