

Required Report: Required - Public Distribution

Date: April 02, 2025

Report Number: TU2025-0014

Report Name: Oilseeds and Products Annual

Country: Turkiye

Post: Ankara

Report Category: Oilseeds and Products

Prepared By: FAS Staff

Approved By: Michael Francom

Report Highlights:

Facing dry growing conditions and slumping cotton prices, Turkish farmers are expected to switch from cotton to produce more sunflowerseeds and other row crops in marketing year (MY) 2025/26. However, even with this anticipated increase in sunflower production, Turkiye will continue to rely on imports of sunflowerseeds, sunflower oil, sunflower meal, soybeans, and soy meal to satisfy its growing domestic requirements. In the case of soybeans, imports are forecast to hit a new record in MY 2025/26, based on the steadily increasing demand from the animal feed sector, especially for poultry and aquaculture feed. The share of Turkiye's oilseed and vegetable imports that are processed and re-exported to neighboring countries is also expected to keep growing.

Oilseeds

In MY2025/26, Türkiye's total production of oilseeds – sunflowerseeds, cottonseeds and soybeans – is projected to increase slightly year-over-year to nearly 2.9 million metric tons (MMT). This increase in overall oilseed production is primarily attributed to the projected expansion in sunflowerseed production which will more than offset the forecasted contraction in cottonseed production.

In response to persistent dry weather conditions and slumping international prices for cotton, Turkish farmers this spring are planning to switch away from cotton and plant other row crops such as sunflowerseeds, which are considered a more drought-tolerant crop and better suited to the current dry soil conditions. For the same weather-related reasons, some farmers are expected to plant more canola this year, though production is expected to remain relatively limited. The drought-affected areas in the country closely coincide with the major production centers of oilseeds, especially for sunflowerseeds and cottonseeds. See drought and crop production maps below.

Soil moisture conditions heading into the spring planting season for the MY 2025/26 crop appear bleak after a very dry fall and winter season. According to the [Turkish State Meteorological Service](#), nationwide precipitation amounts from October through February were down 29 percent below the average. In addition, according to news reports, dam and reservoir levels in different parts of the country are reportedly lower than normal after failing to fully recharge after several years of persistent dry weather. As a result, at least one municipal government in a cotton-growing area on Türkiye's west coast has imposed restrictions on the use of irrigation water in 2025. Depending on water availability in other parts of the country, provincial governors, in consultation with farmer groups and other stakeholders, may also decide to impose limits on irrigation water in the coming months.

In the fall of 2024, the Ministry of Agriculture and Forestry announced an Agricultural Production Plan ([GAIN TU2025-0012](#)) to strengthen national food security amid changing climactic conditions. The new production model prioritizes water conservation by incentivizing the production of less water intensive crops in water scarce regions. According to industry contacts, the impact of this plan won't likely be felt in MY 2025/26 since most farmers are still trying to understand how the new program will work.

In recent years, the Turkish government has tried to balance its support for oilseed production against the need to import oilseeds and derivative products to meet domestic consumption requirements, while simultaneously attempting to tamp down on pesky food inflation. In carrying out this delicate balancing act, the government periodically reduces the import tariffs for oilseeds, meal, and oil. The effective period of the tariff cuts typically does not coincide with the local oilseed harvest in order to protect domestic farmers' profitability. The latest tariff cut that is currently in effect (Jan-Apr) is for 1.0 MMT of sunflowerseeds or sunflower oil equivalent. See annex for current tariff rates for imported oilseeds and derivative products.

Area Harvested – Sunflowerseed

In MY 2025/26, sunflowerseed harvested area is projected to increase year-over-year by about 10 percent to 760,000 hectares (ha). This projected expansion is based on the market expectation that some farmers, especially those in regions of the country that are currently experiencing drier-than-normal weather and soil conditions and facing potential water restrictions, will increase production of drought-tolerant crops like sunflowerseed. The planting of the MY 2025/26 sunflower crop will begin in late March and finish in May.

This forecasted expansion in sunflowerseed area will likely be most noticeable in the Central Anatolia and the Cukurova regions, located in the center and south-central parts of the country, where some farmers are expected to plant more sunflowerseed instead of water-intensive crops like corn and sugar beets because of dry soil conditions resulting from limited precipitation this past fall and winter. In contrast, in the Thrace region located in the northeast part of the country where 40 percent of the country's sunflowerseed is grown, the move to sunflowers will be less visible since the region already predominantly grows sunflowerseed and other row crops that require less water, like wheat, barley, and canola.

Farmers in the southeastern part of the country, which is also facing dry weather and soil conditions, are reportedly planning to experiment with planting small pilot plots of sunflowerseed instead of water-intensive cotton. These pilot plots are expected to be small in size and will, as a result, have a very minimal impact on overall sunflowerseed production. However, the fact that farmers in this region are experimenting with sunflowerseed suggests the water challenges are becoming more acute and it also may be the start of a new trend of sunflower production in the southeast, which has historically mostly grown cotton, corn, and wheat.

The government's newly announced Agricultural Production Plan, which prioritizes water conservation by incentivizing the production of less water intensive crops in water scarce regions, may also encourage some farmers to plant more sunflowerseeds this spring. However, from Post's perspective, the overall impact of this new program on sunflowerseed (and other row crops) production will be minimal for the next couple years as farmers figure out how the program will actually work in practice.

The forecasted sunflowerseed area harvested will be divided between seeds for crushing, confectionary (i.e. snacking), and planting seeds. The projected increase in overall sunflowerseed area harvested will predominantly come from sunflowerseeds for crushing. Area harvested in confectionary seeds is expected to shrink a little due to a softening in prices resulting from an oversupply on the domestic market. As a result, a few confectionary seed growers are expected to switch and plant more sunflowerseed for crushing this spring, but the overall impact on the production on crushing seeds will likely be negligible. Meantime, sunflowerseed planting seed area is predicted to stay relatively flat.

Production – Sunflowerseed

With an anticipated expansion in area harvested, the production of sunflowerseed in MY 2025/26 is forecast to grow about 15 percent year-over-year to about 1.55 million metric tons (MMT). While still below the long-term average, yields are expected to slightly improve from the previous year and contribute to higher production. For reference, MY 2024/25 yields were lower than usual in large part because of persistent drought conditions during the growing season in Thrace where a large percentage of the country's sunflower crop is produced.

Post estimates that approximately 90 percent of MY 2025/26 sunflowerseed production will be crushing seeds with the rest made up of confectionery and planting seeds.

Consumption – Sunflowerseed

MY 2025/26 sunflowerseed consumption is forecast to tick up slightly higher year-over-year to 1.83 MMT. This projected increase parallels the projected growth in domestic sunflowerseed production and assumes higher crush demand along with steady demand for confectionary seeds. The key driver behind sunflowerseed consumption is the growing household demand for sunflower oil.

The MY 2024/25 consumption estimate is adjusted higher to about 1.83 MMT, based on an expected increase in imported sunflowerseeds for crushing because of the government's lower-duty import quota.

Trade – Sunflowerseed

Imports

Owing to the projected increase in domestic sunflowerseed production, imports for MY 2025/26 are forecast down year-on-year by 200,000 MT to 400,000 MT.

A few years ago, Russia and Ukraine were the top suppliers of sunflowerseed to Türkiye. However, imports from those two countries have declined in recent years as exporters in those countries have prioritized shipping value-added sunflower oil instead of sunflowerseed. This trend is expected to continue for the foreseeable future, meaning that most of Türkiye's imported sunflowerseed will likely come from other Black Sea countries and neighboring European countries. In the meantime, a large share of this imported sunflower oil is crude oil that is being refined and re-exported from Türkiye. See graph below showing the shifts in sunflowerseed and sunflowerseed oil trade in the last decade.

The MY 2024/25 import estimate was raised higher to 600,000 MT, based on the latest trade data and the expectation that the government's lower-duty import tariff rate quota (TRQ) will spur increased demand for imported sunflowerseed. Sunflowerseed imports during the first four months of MY 2024/25 (Sep-Jan) totaled almost 132,000 MT, which was about 20 percent higher than the same period last year. The leading suppliers were Moldova (61,000 MT) and Romania (55,000 MT).

In August 2024, Turkiye announced a tariff rate quota (TRQ) for 1.0 MMT of sunflowerseeds or sunflower oil equivalent. The quota details are outlined in [Turkiye Announces Tariff Quota for Sunflowerseed-Crude Sun Oil \(GAIN TU2024-0034\)](#). In November, by way of [presidential decree](#), the in-quota duty was revised lower from 8 percent to zero with same effective dates. In a separate [presidential decree](#) that same month, the out-of-quota tariff was reduced to 12 percent. Local industry insiders are currently predicting that the quota will be evenly divided between sunflowerseed and sunflower oil. See Annex below for current tariff rates.

Figure 3: Sunflowerseed and Sunflower Oil Imports vs Sunflower Oil Exports (Metric Ton)

* Estimate **Forecast

Exports

Sunflowerseed exports in MY 2025/26 are forecasted to remain nearly unchanged from the previous year at 120,000 MT. Based on Post's analysis, about three-quarters of this projected amount will be transshipments from Black Sea countries and the remainder will be made up of domestically produced hybrid sunflowerseeds for planting. Most transshipments are sent to Iraq for crushing, according to industry sources.

The MY 2024/25 export estimate is adjusted higher year-over-year to 125,000 MT, due to an expected increase in confectionary seed shipments resulting from an unexpected oversupply on the local market. Exports during the first four months of MY 2024/25 (Sep-Jan) increased year-on-year to almost 102,000 MT. The leading destinations were Iraq (19,000 MT), Syria (13,000 MT), and Algeria (12,000).

In the last decade, Türkiye has become a major transshipment hub for sunflowerseeds and other agricultural products. For more details, please refer to [Türkiye Becomes Global Transshipment Hub for Agricultural Products \(GAIN TU2024-0039\)](#).

Stocks – Sunflowerseed

In MY 2025/26, sunflowerseed stocks are forecast to remain unchanged from the previous year at 140,000 MT and in line with historical amounts. Most sunflowerseed stocks are held by the private sector.

Area Harvested – Soybeans

MY 2025/26 soybean area harvested is projected to remain unchanged from the previous year's updated figure at 38,000 hectares. The Cukurova region in the south part of the country bordering the Mediterranean Sea is the main soybean growing area, accounting for about 90 percent of total production. Soybean planting is expected to begin in April.

The MY 2024/25 area harvested number is adjusted slightly higher to 38,000 hectares to account for soybean trial plantings in different parts of the country. In recent years, small trial soybean plantings have started in the Central and Southeastern Anatolia regions as well as the Black Sea region. Depending on the outcome of these ongoing trials, these regions may increase soybean planting in the future, but volumes are expected to be relatively small for the foreseeable future since other row crops are expected to remain more profitable than soybeans. Soybeans are still predominantly viewed as a rotational crop to revitalize soil health and not necessarily as a cash crop.

Production – Soybeans

With acreage harvested remaining flat from year-to-year, MY 2025/26 soybean production is forecast to remain unchanged at 150,000 MT. In contrast to sunflowerseed production, the dry weather conditions during the fall and winter months are not expected to spur farmers to plant more soybeans this spring since other row crops remain more profitable.

In recent years, Türkiye has reportedly increased its production of organic soybeans, though these represent just a small fraction of overall soybean production. According to different sources, a large percentage of organic soybeans produced in Türkiye are exported, including to the United States.

Consumption – Soybeans

MY 2025/26 soybean consumption is forecast modestly higher from last year to about 3.73 MMT, based on the growing demand for soybeans and by-products, especially soy meal in poultry feed rations. The continued expansion in the poultry industry and, to a lesser extent, in the emerging aquaculture industry will help drive increased soybean consumption.¹

The MY 2024/25 consumption estimate for soybeans is adjusted slightly higher to 3.55 MMT because of stronger-than-expected crush demand and demand for full-fat soybeans. Türkiye continues to utilize significant amounts of full-fat soybeans in manufacturing animal feed, especially for poultry. See meal section of report for additional details.

Trade – Soybeans

Imports

With domestic soybean production volumes flat and demand increasing, soybean imports are expected to continue along their upward trajectory reaching a record of 3.65 MMT in MY 2025/26.

The MY 2024/25 import estimate for soybeans remains unchanged at 3.5 MMT, though up year-on-year about 8 percent. During the first five months of MY 2024/25 (Sep-Jan), soybean imports totaled 1.4 MMT, which was 40 percent higher than the same period the prior year. Industry contacts cited competitive U.S. soybean prices as one of the key factors behind this growth in total imports, while noting that the pace of shipments from all origins will likely slow in the second half of the marketing year given the large volumes imported during the first half of the year. The leading suppliers were the United States (531,000 MT), Ukraine (523,000 MT), and Brazil (250,000 MT).

For historical context, in a little more than a decade, the volume of soybean imports has doubled as Türkiye's feed industry has expanded and soy utilization has grown. Import volumes will likely continue growing in the future, especially to support the rising demand for soybeans in animal feed production. The Turkish government and other sectoral pundits often lament the growing volumes of soybean imports and have pushed to increase domestic soybean production. However, domestic soybean production hasn't taken off in large part because other row crops remain more profitable to produce.

Exports

MY 2025/26 soybean exports are forecast to remain unchanged year-over-year at 75,000 MT. Based on Post's analysis of historical trade data, the majority of this forecasted amount is expected to be transshipments, mostly from Black Sea countries.

The MY 2024/25 soybean export estimate is revised marginally higher from the prior year to 75,000 MT. During the first five months of MY 2024/25 (Sep-Jan), soybean exports totaled 35,700 MT. The main export destination was the United States (35,000 MT). According to U.S. trade data, all the shipments of soybeans from Turkiye were organic. Based on recent trading patterns, Post understands that some of the organic soybeans exported to the United States were grown in Turkiye and others are being transshipped from third countries.

Stocks – Soybeans

For MY 2025/26, soybean stocks are forecast unchanged from the prior year’s updated number at 160,000 MT. All stocks are held by private companies.

OFFICIAL DATA CAN BE ACCESSED AT: PSD Online Advanced Query						

Area Harvested – Cottonseed

MY 2025/26 cotton area harvested is projected to contract about 8 percent to 430,000 hectares. This anticipated contraction is based on multiple interrelated factors, including depressed international cotton prices, sluggish domestic demand for cotton, dry weather and soil conditions, and the option to plant more profitable row crops like wheat and corn. Cotton planting will start in April and finish by May. Given the dry weather conditions this past fall and winter, Post expects to see some municipal governments enact water restrictions in the coming months. The provincial government in Aydin, which is located on Turkiye’s Aegean coast where cotton is a major staple, has already announced that the province will reduce its irrigation water consumption by 50 percent from last year because reservoir

levels are already low. Some farmers from Aydin are complaining that they won't be able to grow certain crops, like cotton, without access to water.

Production – Cottonseed

In line with the expected contraction in area harvested, MY 2025/26 cottonseed production is forecast lower year-over year at 1.21 MMT.

For more detailed information on the cotton production situation in Turkiye, please refer to our annual cotton report for 2025.

Consumption – Cottonseed

MY 2025/26 cottonseed consumption is forecast at about 1.23 MMT, down year-to-year by nearly 100,000 MT because of the expected decrease in domestic cottonseed production. Almost all consumption originates from domestically grown cottonseeds.

Trade – Cottonseed

MY 2025/26 cottonseed imports are projected to remain unchanged from the previous year at 30,000 MT. Cottonseed imports are generally very small because of the availability of substitutes, like domestic sunflowerseeds or imported soybeans.

The MY 2024/25 import estimate for cottonseed imports remains at 30,000 MT, but down year-over-year because of a downturn in shipments from Syria. Cottonseed import during the four months (Oct-Jan) of the current marketing year totaled about 8,400 MT, down about 40 percent from the prior year. The leading suppliers were Azerbaijan (8,100 MT) and Syria (306 MT).

Stocks – Cottonseed

MY 2025/26 cottonseed stocks are forecast at 15,000 MT, nearly unchanged from the previous year and in line with historical trends.

OILSEED MEALS

In MY 2025/26, the total production of oilseed meals – sunflowerseed meal, soybean meal and cotton seed meal – is forecast to increase one percent year-over-year to about 3.44 MMT. The projected increase in sunflowerseed meal and soybean meal production will just barely compensate for the predicted decline in the production cottonseed meal.

The demand for oilseed meal is closely tied to the production and use of compound feed in Turkiye's livestock, poultry, and aquaculture sectors. Industry sources consistently predict steady year-over-year growth in compound feed production based, in large part, on the country's growing demand for meat, poultry, eggs, fish, and other livestock products. Export demand for these products is also cited as a contributing factor for the growth in compound feed production and consumption. Another reason for this purported steady growth is said to be the ongoing registration of farms, some of which have on-farm feed mills, in the government's Farmer Registration System (CKS). Registration allows the government to better account for feed production on these farms, most of which are relatively small, and entitles the farmer to government support.

According to market sources, the inclusion rate for oilseed meals in compound feed production is constantly changing based on these products' latest prices and availability. As a general rule of thumb, about half of Türkiye's compound poultry feed is made from soybean meal. Soybean meal is generally more profitable than soy oil because most soybean oil cannot be used for human consumption since it's made from genetically engineered beans. In contrast, sunflowerseed meal is predominantly used in compound feed for livestock and is generally less profitable than sunflower oil.

In line with compound feed industry's growth expectations and Post's oilseed production and import projections, Post predicts oilseed meal consumption to increase by about 4 percent in MY 2025/26. This projected increase is partly based on the expectation of increased soymeal usage in the country's production of chicken meat for the domestic and export markets. Chicken production in Türkiye, which is the world's eighth largest producer, is forecast to grow by 8 percent in 2025, according to the latest USDA PSD numbers.

According to industry contacts and Post analysis, a projected decrease in dairy cow inventories for the third straight year in 2025 is not expected to have a noticeable impact on compound feed demand and by extension oilseed meal utilization. The reason is because Türkiye is expected to import large numbers of feeder cattle for slaughter in 2025 that will require compound feed for fattening and will thereby offset any potential declines in reduced demand from the dairy sector.²

Based on Post estimates, soy products, both conventional meal and full fat meal, are forecast to account for about two-thirds of total meal consumption in MY 2025/26. See table 2. Since most of this soybean meal is derived from imported soybeans, industry analysts argue that the feed sector is overly dependent on imported soybeans. However, what is often overlooked in this argument is the tradeoff between increased domestic soybean production and the necessary corresponding decrease in production of other important crops. Additionally, this argument typically fails to acknowledge that imported soybeans are one of the major ingredients needed to sustain the country's production of value-added meat, eggs, and fish, with a large share of these products going for export.

According to industry figures, compound feed production in calendar year 2024 grew by 5 percent year-over-year to 29.3 MMT. Ruminant and poultry compound feed, accounted for 60 percent and 38 percent, respectively, of overall compound feed production with both categories registering year-over-year growth.

There are about 600 large and medium-sized feed mills in Türkiye with an estimated production capacity of 40.0 MMT. Capacity is currently more than sufficient to meet feed demand requirements. In recent years, there has been a wave of consolidation across the industry as new modern mills with large-scale operations come online. Besides these commercial operations, there are more than 600 on-farm feed mills which produce their own feed. (Note: the production on these farms is unknown and not counted in the industry production numbers in the table below since these operations are unregistered in the CKS.)

Crush margins vary based on oilseed type and are generally positive due to the growing demand for vegetable oil and meal. Based on Post's understanding of the oilseed market, the crush margins for soybeans are generally higher than sunflowerseeds. The reason for this difference, according to contacts, is because the government's periodic tariff cuts on sunflower seeds and sun oil imports, and its pressure

on crushers to keep sunflower oil prices from increasing, creates considerable uncertainty for their business and eats into their profitability.

OFFICIAL DATA CAN BE ACCESSED AT: PSD Online Advanced Query						

Production – Sunflowerseed Meal:

MY 2025/26 sunflowerseed meal production is forecast almost unchanged from the previous year at about 888,000 MT, assuming a steady increase in crush demand resulting from growing animal feed production.

The MY 2024/25 sunflowerseed meal production estimate is revised higher to nearly 886,000 MT, based on an increase in sunflowerseed imports for crushing.

Consumption – Sunflowerseed Meal:

MY 2025/26 sunflowerseed meal consumption is projected to increase slightly from the previous year to about 2.2 MMT. This forecasted amount assumes that the utilization of sunflowerseed meal will expand in line with the growing demand for animal feed.

The MY 2024/25 sunflowerseed meal consumption estimate is revised higher to 2.1 MMT, based on larger-than-expected imports of sunflowerseed during the first five months (Sep-Jan) of the marketing year resulting from the TRQ for sunflowerseed (or oil equivalent).

Trade – Sunflowerseed Meal:

Imports

MY 2025/26 sunflower meal imports are forecast at nearly 1.37 MMT, up year-to-year assuming stable demand from the local feed sector and attractive prices for imported sunflower meal from Black Sea suppliers. Even with the predicted increase in domestic production of sunflowerseed meal, imports are projected to increase to meet the growing demands of the feed sector.

The MY 2024/25 import estimate is adjusted higher to 1.25 MMT, up almost 30 percent from the USDA figure. This upward adjustment is based on the latest trade data and the availability of competitively priced sunflowerseed meal from Black Sea suppliers. According to industry sources, contract prices have become more attractive in recent years due to the increased availability of sunflowerseed meal from Russia and Ukraine as both countries have expanded their crush volumes in order to sell more value-added sunflowerseed oil to Türkiye and other markets.

Competitive import prices spurred higher-than-expected import volumes during the first five months (Sep-Jan) of MY 2024/25, with imports climbing 60 percent year-on-year to 573,000 MT. The leading suppliers were Russia (484,000 MT), Ukraine (71,000 MT), and Romania (15,000 MT). According to traders, the pace of imports is expected to slacken a little in the second half of the year as import contract prices are predicted to climb higher as suppliers' inventories become tighter.

Stocks – Sunflowerseed Meal

In MY 2025/26, sunflowerseed meal stocks are forecast at 166,000 MT, down slightly from the previous year's newly revised figure.

Production – Soybean Meal:

Assuming that crush demand will continue to incrementally expand each year, soybean meal production in MY 2025/26 is projected to slightly increase from last year to 1.88 MMT. Soybean meal production has grown in recent years due to favorable crushing margins and increased utilization in animal feed rations, mainly poultry and aquaculture feed. Most soybean meal is made from imported soybeans.

Soybean meal production in MY 2024/25 is estimated at nearly 1.8 MMT, slightly higher than prior year due to steady crush demand and improved crush margins that are expected to continue throughout the year.

Consumption – Soybean Meal:

MY 2025/26 soybean meal consumption is forecast up slightly from the previous year to about 2.38 MMT. This forecasted increase keeps with the recent trend of incrementally increasing soymeal demand in animal feed.

The MY 2024/25 consumption estimate for soybeans meal revised up slightly up from last year at 2.3 MMT, which parallels the growing demand from the feed sector, especially for poultry rations.

Trade – Soybean Meal:

Imports

MY 2025/26 soybean meal imports are forecast at 1.55 MMT, which is nearly unchanged from the previous year's newly revised estimate and assumes steady transshipment demand. A large share of soybean meal imports are transshipped, especially to Iraq and Iran. See export section for more detail on transshipments.

With the predicted increase in soymeal production, the import estimate for MY 2024/25 is trimmed back to about 1.53 MMT. Import volumes during the first four months (Oct-Jan) of the MY 2024/25, totaled about 414,000 MT, which was about 4 percent lower compared to the same period the prior year. Most of the imported soybean meal was sourced from Argentina (317,000 MT) and Brazil (70,000 MT).

Exports

MY 2025/26 soybean meal exports are forecast at 1.05 MMT, assuming stable demand for transshipments, especially to Iraq and other neighboring countries. According to local industry contacts, Iraq relies on these shipments since the production of soy meal in that country reportedly remains insufficient to meet the needs of its growing poultry industry. Post assumes this demand from Iraq will remain steady.

Based on Post analysis, around 85 percent of Turkiye's soybean meal exports for the last five-years were transshipments. For more details on the reasons why Turkiye has become a global transshipment hub for soybean meal and other agricultural products, please refer to [GAIN TU2024-0039](#).

In line with the latest trade numbers and market expectations, the MY2024/25 soybean meal export estimate is revised higher to 1.05 MMT, an increase of about 25 percent above the USDA estimate though roughly in line with the amount the previous year. Export volumes during the first four months (Oct-Jan) of MY 2024/25 were about 10 percent lower compared to the same period the prior year due to a decrease in shipments to Iran. Exports are expected to accelerate given competitive export pricing and growing demand from Iraq. The main export destinations were Iran (120,000 MT) and Iraq (112,000 MT).

Stocks – Soybean Meal

In MY 205/26, soybean meal stocks are forecast at 377,000 MT, almost unchanged from the previous year's newly revised estimate. The stock-to-use ratio for soymeal is the highest of all oilseed meals, averaging about 16 percent for the last three years. In contrast, the stock-to-use ratio for sunflowerseed

meal for this same period was about 8 percent. Based on Post's analysis, the main reason for the higher higher-stock-to-use ratio for soymeal is because of the sizeable volumes of transshipped soymeal that may be stored in the country for months at a time before being sent to its final destination.

Production – Cottonseed Meal

Cottonseed meal production in MY 2025/26 is forecast to modestly decrease year-over-year to 675,000 MT, based on the expected contraction in domestic cottonseed production.

Consumption – Cottonseed Meal

MY 2025/26 cottonseed meal consumption is forecast down from the previous year to 671,000 MT, paralleling the decrease in domestic cottonseed meal production. Almost all the cottonseed meal consumed is made from domestically grown cottonseed.

The MY 2024/25 cottonseed meal consumption estimate is adjusted to 722,000 MT, which is up year-over-year in parallel with the increase in cottonseed meal production.

Trade – Cottonseed Meal

Imports

MY 2025/26 cottonseed meal imports are projected unchanged from the previous year's newly revised number of 6,000 MT. Based on latest trade numbers to date, the MY 2024/25 cottonseed meal import estimate is adjusted lower to 6,000 MT, based on a downturn in imports from Syria, the main supplier, during the first part of the marketing year.

Exports

MY 2025/26 cottonseed meal exports are forecast unchanged from last year at 10,000 MT, based on the assumption that most of this trade is transshipments passing via Türkiye to third countries. Türkiye mainly exports cottonseed meal to Lebanon and Syria.

VEGETABLE OILS

The MY 2025/26 total vegetable oil production forecast is down 9 percent year-to-year to about 1.63 MMT, based on the expected decrease in the production of cottonseed oil and olive oil. Olive oil production is predicted to contract because of natural cyclical production patterns and cottonseed oil is forecast down because of reduced cottonseed production.

Sunflower oil is the most widely produced and consumed vegetable oil in Turkish households. Cottonseed and olive oil jockey back and forth as the second most consumed oil. Soybean oil is the least consumed, even though sizeable volumes are produced. Most of the soybean oil is exported because it is made from genetically engineered beans and not allowed for domestic consumption. Depending on their price and availability, consumers also use vegetable oils made from canola, corn, safflower, and camelina.

Table 3: Vegetable Oil for Human Consumption (1,000 MT)			
	MY 2023/24	MY 2024/25	MY 2025/26
Sunflowerseed Oil	1,400	1,295	1,355
Olive Oil	185	275	195
Soybean Oil	2	2	2
Cottonseed Oil	180	223	205
Total	1,767	1,795	1,757

Source: Retail Markets

Türkiye does not produce sufficient volumes of affordable vegetable oil for Turkish households. As a result, the country relies on large quantities of imported sunflowerseed oil and sunflowerseeds for crushing, most of which is sourced from Black Sea countries. Türkiye also sources sizeable volumes of imported crude sunflowerseed oil for refining and re-export to neighboring countries. In addition, Türkiye exports vegetable oil made from imported soybeans, some of which are U.S. origin beans, and also exports domestic olive oil.

Türkiye continues to invest in expanding its capacity for crushing oilseed seeds and refining vegetable oil. In 2024, Türkiye's total crushing capacity was about 9.0 MMT with a capacity utilization rate of 80 percent. Türkiye's oil refining capacity for this same period was 4.5 MMT with a capacity utilization rate of 85 percent. There are also two new factories that will come online in MY 2025/26 that will produce high protein soy meal and oil. These investments are examples of the continued expansion in the country's crushing sector to meet domestic and export demand for both meal and oil.

Türkiye continues to grapple with high food inflation. For example, the price of sunflowerseed oil in March 2025 was 60 percent higher compared to March of last year. The Turkish government

periodically intervenes in the market to stabilize prices by cutting tariffs on imported sunflowerseeds and sunflower oil. Facing the prospect of rising prices for sunflower oil, the government instituted a lower-duty tariff rate quota (TRQ) from January to April of this calendar year. Crude sunflower oil imports are expected to accelerate in line with the effective period of the TRQ.

Production – Sunflowerseed Oil

The production of sunflowerseed oil in MY 2025/26 is projected at 709,000 MT, up year-over-year by 6 percent. This increase is mostly attributed to the expected larger crush compared to the previous year.

Consumption – Sunflowerseed Oil

MY 2025/26 sunflower oil consumption is forecast marginally higher from the previous year at 1.36 MMT, as demand remains strong. Sunflowerseed oil is the most widely consumed cooking oil in Türkiye because of its affordability.

MY 2024/25 sunflower oil consumption estimate is about 1.34 MMT, modestly lower than previous year in response to the increased availability of relatively more affordable olive oil.

Trade – Sunflowerseed Oil

Imports

MY 2025/26 sunflowerseed oil imports are forecast at 1.53 MMT, up year-over-year by 180,000 MT. This anticipated increase assumes a growing availability of sunflower oil imports from Russia and Ukraine, and steady transshipment demand.

MY 2024/25 sunflowerseed oil imports are estimated lower year-on-year at 1.35 MMT but are higher than the USDA figure due to stronger-than-expected imports from Russia in the first part of the marketing year due to favorable pricing and the availability to import oil at a lower duty under the TRQ from January through April. Of this estimated import volume, about 30 percent is expected to go for domestic consumption, 45 percent for refining and re-export, and the rest for transshipment. Iraq and Syria were the main destinations for transshipments, most of which were crude oil.

In addition to the TRQ, the Turkish Grain Board (TMO) announced a tender in March for 18,000 MT of imported crude sunflower oil. The purpose of the tender, according to sources, is to help procure needed sunflower oil to stabilize domestic market conditions and keep prices from increasing.

From September to January in MY 2024/25, sunflowerseed oil imports reached nearly 440,000 MT, down more than 15 percent from the same period last year. The leading suppliers were Russia (324,000 MT) followed by Ukraine (92,000 MT).

Exports

MY 2025/26 sunflowerseed oil exports are projected higher than the previous year at 850,000 MT, assuming strong re-export and transshipment volumes to key markets in Africa and the Middle East. According to industry contacts, the sector plans to reclaim some of its lost market share to Black Sea competitors by leveraging Türkiye's existing processing capacity and logistical competitiveness.

The MY 2024/25 sunflowerseed oil export estimate is 730,000 MT, down significantly year-over-year resulting from a slowdown of exports due to strong competition from Black Sea sunflower oil exporters, the availability of competitively priced soybean oil, and limited availability of sunflowerseed from Ukraine. One other reason for the anticipated decline in exports is a recent payment problem for shipments to Djibouti.

In the first five months of MY 2024/25 (Sep-Jan), exports dropped to 367,000 MT, down about 24 percent compared to the same time last year. The main export destinations were Iraq (75,000 MT), Djibouti (59,000 MT), and Syria (41,000 MT).

Stocks

MY 2025/26 sunflowerseed oil stocks are forecast remain to remain almost unchanged from the previous year at 155,000 MT.

Production – Soybean Oil

MY 2025/26 soybean oil production is projected to increase by 4 percent year-to-year to 449,000 MT, based on the prediction that Türkiye will import more soybeans for crushing.

The MY 2024/25 soybean oil production estimate is adjusted higher to 430,000 MT, based on strong crush demand.

Consumption – Soybean Oil

MY 2025/26 soybean oil consumption is expected to remain steady year-over-year at 52,000 MT. This figure would likely be higher given rising soybean imports, but the country's Biosafety Law prohibits the human consumption of vegetable oil made from genetically engineered (GE) soybeans. This effectively means that food use soy oil can only be made from conventional soybeans. Soy oil made from GE soybeans can only be exported, used in livestock feed, or used to make ink or paint.

In recent years, soybean oil, including GE soy oil, is increasingly being utilized by the animal feed industry to improve feed efficiency. For this reason, Post increased the amount of soybean oil being used in feed to 30,000 MT in MY 2024/25 and MY 2025/26.

Only soybean oil made from domestic, conventional beans is allowed for making biodiesel. About 15,000 MT of soybean oil is used in biodiesel production each year. This amount has remained steady for years.

Trade – Soybean Oil

Exports

MY 2025/26 soybean oil exports are forecast slightly higher year-over-year at 400,000 MT, assuming steady crush demand and rising soybean imports.

The MY 2024/25 soybean oil export estimate is adjusted lower to 370,000 MT, down from the prior year due to increased competition from Ukraine and Russia in African and the Middle Eastern markets. Contacts also cited a bigger soybean crush in Egypt as one of the reasons for lower exports to date. For the first four months (Oct-Jan) of MY 2024/25, soybean oil exports dropped 20 percent year-on-year to nearly 100,000 MT. Leading destinations were Algeria (67,000 MT) and Iraq (6,800 MT).

Stocks

MY 2024/25 soybean oil stocks are forecast slightly higher than the previous year at 7,000 MT.

Production – Cottonseed Oil

MY 2025/26 cottonseed oil production is forecast at 219,000 MT, down year-over-year by nearly 8 percent because of the projected decrease in domestic cottonseed production.

Consumption – Cottonseed Oil

MY 2025/26 consumption is forecast at 216,000 MT, down year-over-year by nearly 7 percent. Cottonseed oil is mainly used for making margarine, while small amounts are also used for industrial purposes. In years when cottonseed oil is in short supply, the food industry uses other alternative oils such as sunflower, soybean, cotton, canola, palm and derivatives.

Trade – Cottonseed Oil

Import

MY 2025/26 cottonseed oil exports are forecast unchanged from the prior year at 2,000 MT. Azerbaijan has dominated almost all trade in recent years.

Exports

MY 2025/26 cottonseed oil exports are forecast unchanged from the prior year at 4,000 MT.

MY 2024/25 cottonseed oil exports are revised down to 4,000 MT. Cottonseed oil exports during the first four months (Oct-Jan) of MY 2024/25 were about 600 MT, which is half the amount during the same period the previous year.

Stocks – Cottonseed Oil

MY 2025/26 cottonseed oil stocks are forecast to remain unchanged year-on-year at 14,000 MT.

Production – Olive Oil

Olive oil production in MY 2025/26 is forecast to decrease year-to-year by almost 40 percent to 250,000 MT. This anticipated decrease in production is in line with the cyclical nature of olive production with one year an on-year and the next an off-year in terms of yields. MY 2025/26 is expected to be an off-year.

MY 2024/25 olive oil production is revised higher to 400,000 MT, based on the latest olive crop harvest reports for what was considered an “on year.” Suitable weather conditions for olive production prevailed

during most of the growing season, which helped nudge production a little higher, except in Bursa and Balıkesir on the west coast of the country where drier-than-usual weather conditions caused a portion of the olives without access to irrigation to shrivel due to the lack of water. This situation was particularly problematic for table olive growers since they could no longer sell their olives for table use and instead had to sell them for oil and meal production. This diversion was also a factor contributing to increased production this marketing year.

Olive growers continue to make investments to improve their yields. They are investing in drip irrigation systems to conserve scarce water resources. Olive trees are generally drought-tolerant, but still require regular watering, especially when the tree is young or bearing fruit. Farmers are also adopting more modern harvesting methods, such as hand-held harvest machines, to reduce damage to the fruit and reduce losses.

The Turkish government continues to provide incentives to encourage farmers to grow more olive trees and start new olive orchards. Owing to these incentives and the profitability of the olive oil business, the number of olive trees has continued to expand over the last decade, reaching 190 million trees in 2024, of which 155 million are assumed to be fruit bearing trees. The number of trees is expected to steadily increase in the coming years, contributing to increased olive oil production in the future. Olive trees are mostly planted along the Aegean and Mediterranean seas and also in the Southeast Anatolian region.

Consumption – Olive Oil

MY 2025/26 olive oil consumption is expected to decrease year-to-year by about 90,000 MT to 195,000 MT, based on the off-year cyclical downturn in olive production.

With the upward revision to MY 2024/25 olive oil production, consumption for this period is adjusted higher to 275,000 MT. The increase in domestic production combined with a softening in international olive oil prices have contributed to local prices dropping by 40 percent compared to last year. As of March 2025, the price for extra virgin olive oil retailed for \$6.5 per liter compared to about \$10.5 per liter the same time a year ago.

Consumers consider olive oil to be superior to other cooking oils. Prices are currently about 4 times higher than sunflower oil, which is the most widely consumed vegetable oil in Türkiye. As a result of this price difference, olive oil is often adulterated with other, cheaper, vegetable oils and sold as “olive oil” at a more affordable price in the local market. In the last few years as Türkiye has struggled to tame rising food inflation, the scope of adulteration in the marketplace appears to have increased, based on the number of local news stories on this topic. In response, the Ministry of Agriculture & Forestry (MinAF) has announced different measures, including increased facility inspections and fines, to root out this fraudulent practice.

Domestic olive oil consumption has increased over the years, especially among health-conscious city dwellers who typically have more disposable income. For most middle and low-income consumers, olive oil consumption is largely influenced by the prices of other cheaper alternatives, especially sunflower oil and butter. Budget-stretched consumers will often substitute these alternatives for some of their olive oil consumption though they generally keep olive oil on hand for salads and other fresh vegetables consumed at mealtime. To afford olive oil, some consumers are buying bulk sized containers, which are generally cheaper than the consumer-packaged bottles, or look for deals at their local discount retailer.

Table 4: Retail Prices of Sunflower Oil and Extra Virgin Olive Oil				
	Sep-2023	Mar-2024	Sep-2024	Mar-2025
Sunflower Oil	27 TL/per liter	40 TL/per liter	45 TL/per liter	65TL/per liter
Olive Oil	230 TL/per liter	330 TL/per liter	400 TL/per liter	240 TL/per liter
Price Difference (Sun/olive)	8.5	8.3	8.9	3.7
FX Rate for \$1	27	32	34	37

Trade – Olive Oil

Exports

Olive oil exports in MY 2025/26 are projected to decrease to 105,000 MT, paralleling the anticipated decrease in domestic olive oil production.

The MY 2024/25 olive oil export estimate is expected to remain unchanged at 155,000 MT. Post believes exports could climb higher in the year, if international olive oil prices recover after having softened due to the large on-year olive crops in Italy and Spain. Some Turkish exporters are reportedly holding their export inventories until international prices recover and may even decide to hold them into the next marketing year if export prices still remain unattractive.

Olive oil exports during the first three months (Nov-Jan) of MY 2024/25 totaled almost 30,000 MT, up about 15 percent from the same period last year. The United States (10,000 MT), Saudi Arabia (3,000 MT) and Jordan (2,500 MT) were the main export destinations. Export sales to Spain – one of the leading destinations for Turkish olive oil – were minimal during this period because of an increase in Spanish olive oil production.

Turkish olive oil exporters are seeking to sell more of their oil to the United States, Japan, and other markets. To expand sales to the United States, exporter unions have featured Turkish olive oil at U.S. trade shows and organized different promotional events to increase U.S. consumers' awareness of Turkish olive oil. These efforts appear to have paid dividends as the United States was the biggest buyer of Turkish olive oil in 2024, with sales topping \$205 million, according to Turkish trade statistics.

Imports

MY 2025/26 olive oil imports are projected to remain unchanged from the previous year at 40,000 MT, based on the expectation that shipments from neighboring Syria, the main supplier, will remain stable. MY 2024/25 olive oil imports are estimated at 40,000 metric tons. Olive oil imports during the first three months (Nov-Jan) of MY 2024/25 totaled about 17,300 MT, nearly all of which came from Syria. Post understands that this small amount of Syrian olive oil is mainly sent to Turkish and Syrian communities living along the border.

Stocks – Olive Oil

MY 2025/26 olive oil stocks are forecast down from the last year at 33,000 MT, based on the expectation that less oil will be produced from the “off year” olive harvest. Stocks could conceivably grow a little bit bigger if exporters decide to hold onto their current stocks into the next marketing year (MY 2025/26) in hopes of better international prices.
