

Required Report: Required - Public Distribution

Date: March 18, 2026

Report Number: BG2026-0001

Report Name: Oilseeds and Products Annual

Country: Bangladesh

Post: Dhaka

Report Category: Oilseeds and Products

Prepared By: Tanvir Ahmed

Approved By: Erin Covert

Report Highlights:

U.S. soybean exports to Bangladesh rose from 48 percent market share in FY 2024/25 to 84 percent in FY 2025/26, driving soybean crushing and feed demand growth. For MY 2026/27, Post forecasts soybean imports at 2.4 million MT. Post forecasts soybean oil imports at 1.5 million MT and palm oil imports at 2.65 million MT. Bangladesh conducted its 13th National Election on February 12, 2026, leading to a formation of government under the Bangladesh Nationalist Party (BNP) led by Prime Minister Tarique Rahman.

Executive Summary

Bangladesh held its 13th National Election on February 12, 2026, and the Bangladesh Nationalist Party (BNP) formed a new government on February 17, marking a historic political return to democratic elections after the fall of the Awami League/Sheikh Hasina regime in August 2024, followed by over a year of the reform-focused Interim Government leadership of Nobel Prize winning economist Muhammad Yunus.

The oilseed and edible oil sectors remain critical for Bangladesh's livestock and dairy sectors.

From July 2025-February 2026 in FY 2025/26, U.S. soybean exports captured 84 percent market share in Bangladesh, compared to 48 percent in FY 2024/25. Soybean crushing is forecast to reach 2.35 million MT in MY 2026/27, supported by growing demand for soybean meals from the feed industry. The feed sector remains the primary driver of soybean demand. Soybean meal consumption in feed is projected to reach 2.9 million MT in MY 2026/27, reflecting the continued expansion of the poultry, aquaculture, and livestock sectors. Several Bangladeshi companies signed Letters of Intent (LOIs) with the U.S. Soybean Export Council in November 2025 to import significant volumes of U.S. soybeans and soybean meal over the following year.

Bangladesh also relies heavily on imported edible oils, with per capita consumption over 24 liters per year. Soybean oil imports are forecast at 1.5 million MT and palm oil imports at 2.65 million MT in MY 2026/27 to meet domestic consumption demand.

OILSEEDS SITUATION AND OUTLOOK

Oilseed production in Bangladesh includes mustard/rapeseed, sesame, groundnut (peanut), sunflower, and soybean. Among these, rapeseed accounts for the largest share of production; however, the varieties grown in Bangladesh are commonly referred to and consumed as “mustard seed.” Sesame and groundnuts are also significant oilseed crops. Sesame is valued for its high oil content, while groundnuts are used both for oil extraction and direct human consumption. Soybean cultivation has been expanding in recent years, largely driven by rising demand from the animal feed industry.

Most oilseeds are cultivated during the rabi (winter) season, which extends from November to March, particularly mustard/rapeseed, soybean, and sunflower. In contrast, sesame and groundnuts are generally grown during the kharif (monsoon) season from June to October. The Government of Bangladesh (GoB) is prioritizing the expansion of domestic oilseed production, particularly “mustard” production and farmers are increasingly adopting improved agricultural practices, including the use of high-yielding varieties and participation in government-supported development initiatives. The Department of Agricultural Extension (DAE), under the Ministry of Agriculture, is providing mustard seed and fertilizer to many farmers in each Upazila for free.

The DAE reported that in Bangladesh fiscal year (FY) 2025-26 (July-June), the total oilseed cultivation area was 1.25 million hectares, with a total oilseed production estimate of 1.69 million metric tons (MT), down 1.9 percent and 2.5 percent, respectively from FY 2024-25 (Table 1). This decrease in FY 2025-26 oilseed acreage and production is mostly due to decreased mustard/rapeseed cultivation because of increased potato production in northern districts of Bangladesh. Domestically produced oilseeds meet about 10 percent of Bangladesh’s edible oil requirements. The remainder is imported as crude oil or as oilseeds.

Based on DAE’s current-year oilseed production estimates and Post’s observations of the overall demand for edible oil and animal feed, Post has increased the forecast for total oilseed area and production in FY 2026-27 to 1.31 million hectares and 1.79 million MT, respectively, compared to the FY 2025-26 estimate.

Domestic oilseed production, primarily rapeseed/mustard, along with smaller volumes of sesame, ground nut, sunflower, and soybean, supplies only a limited share of the country’s edible oil demand. As a result, Bangladesh relies heavily on imports of crude palm oil, soybean oil, and soybeans, with domestic oilseeds meeting roughly 10 percent of total edible oil consumption. Annual edible oil demand is estimated at about 4.8 million MT, with palm oil and soybean oil dominating the market due to their availability and relatively lower prices.

Table 1: Oilseed Area Cultivation and Production in Bangladesh

Crops	FY 2024-25 (Estimate)		FY 2025-26 (Estimate)		FY 2026-27 (Forecast)	
	Area Cultivated (000 Hectare)	Production (000 MT)	Area Cultivated (000 Hectare)	Production (000 MT)	Area Cultivated (000 Hectare)	Production (000 MT)
Peanut	79	145	82	150	90	160
Rapeseed/Mustard	1,040	1,350	1,000	1,280	1,050	1,360
Soybean	96	170	100	175	105	180
Sunflower	10	20	12	22	12	22
Others	60	70	60	70	62	73
Total	1,285	1,755	1,254	1,697	1,319	1,795

Bangladesh's Oilseed Industry in the Current Political Climate

Bangladesh held its 13th National Election on February 12, 2026. Following the election, the BNP, under the leadership of Prime Minister Tarique Rahman, formed the new government on February 17, marking a significant political transition after the interim administration and the end of the previous ruling period. In this evolving political and economic environment, Bangladesh's oilseed and edible oil sector remains strategically important to the country's food security and trade relationships.

Under the new BNP-led government, improving agricultural productivity and reducing import dependence are likely to remain key policy priorities, particularly amid economic pressures such as limited foreign currency availability and global commodity price volatility. However, imports of oilseeds, particularly soybeans, as well as crude soybean oil and palm oil will likely continue at significant levels, as strong domestic demand far exceeds local production capacity.

Soybeans

Production

Post forecasts marketing year (MY) 2026/27 soybean planted area at 105,000 hectares and production at 180,000 MT, an increase of 5 percent and 2.8 percent, respectively, from the MY 2025/26 estimate. Over the past few years, soybean acreage has steadily increased, particularly in the coastal districts of Bangladesh, driven by favorable weather conditions during the growing season, improved marketing opportunities, and higher profitability. The forecast for MY 2026/27 assumes continued favorable weather throughout the growing season.

Bangladesh produces about seven percent of its annual soybean requirement. Soybeans are grown in very limited areas mostly in the southern belt, including Noakhali and Lakshmipur districts in Chattogram Division, and Pirojpur, Patuakhali, Borguna, and Bhola districts in Barishal Division. Domestically produced soybeans are used predominantly in the feed industry. Due to lower oil content and lower protein of the meal, they are not used in oil production. Bangladeshi seed crushers prefer 19–20 percent oil content in soybeans and 44–46 percent protein content in soybean meal. The typical yield of soybean varieties in Bangladesh is 1.7 MT/hectare, notably lower than the global average of 2.8 MT/hectare. Bangladesh does not grow any GE soybean varieties.

In recent years, soybeans have been gaining popularity as a cash crop. The cost of soybean production is lower than other crops as farmers usually do not irrigate their soybeans. Farmers sow soybeans after harvesting *aman* season rice and the remaining soil moisture from rice cultivation supports germination. It takes 100-110 days to harvest the beans. However, the unavailability of high yielding varieties and lack of quality seeds continues to hamper the expansion of soybean cultivation.

Since 1990, more than ten high yield soybean varieties have been released in Bangladesh, but approximately 60 percent of soybean farmers are still cultivating the *shohag* variety, which was officially released in 1991 and has a yield of 1.6-1.8 MT per hectare.

The Bangladesh Agricultural Research Institute (BARI) developed the BARI soybean-5 and BARI soybean-6 varieties, which are planted by about 30 percent of soybean farmers; however, limited seed supply constrains cultivation. The Bangladesh Institute of Nuclear Agriculture (BINA) and the Bangladesh Agricultural University have also released several high yield soybean varieties, but planting is limited.

Recently, Gazipur Agricultural University (GAU) developed and registered a new soybean variety named BU Soybean-5 with the Seed Wing of Bangladesh's Ministry of Agriculture. This variety claims to be high-yielding and short duration. While existing soybean varieties require 100-110 days from sowing to harvest, BU Soybean-5 matures in just 75-85 days. In the current marketing year (MY) 2025/26, approximately 10 percent of the total soybean acreage is planted with BU Soybean-5. If farmers achieve better yields compared to other existing varieties, the adoption of BU Soybean-5 is expected to increase in the coming years.

Based on DAE's crop production data, Post estimates MY 2025/26 soybean harvested area at 100,000 hectares and production at 175,000 MT, up 4.2 percent and 3.1 percent, respectively from MY 2024/25. Farmers reported that they usually keep their own seed for next season's plantation or buy it from the market.

Photo 2: Soybean fields (Post photo from Noakhali district on March 6, 2026)

Consumption

Crush

The total daily soybean crushing capacity in Bangladesh remains at 17,400 MT. Currently, only four soybean crushers are in operation. Crushers report that they are currently operating around 300 days per year at around 50-60 percent capacity, based on domestic demand for soybean oil and meals. Limited supplies of gas also restrict crushers' abilities to maximize on their crushing capacity.

Domestic crushers supply around 25 percent of Bangladesh's soybean oil and 65 percent of the soybean meal requirement. Bangladesh imports the remaining 75 percent of the required soybean oil as crude soybean oil which is refined domestically. According to industry contacts, soybean crushers in Bangladesh primarily rely on the sale of soybean meal rather than soybean oil to generate profits. Because the GoB controls the price of soybean oil, crushers are unable to charge higher prices for oil even when the cost of soybeans increases. Soybean meal is one of the key ingredients in the poultry and aqua feed industry in Bangladesh. However, in the current marketing year, the price of domestically produced soybean meal has declined while the price of soybean oil has increased. In Bangladesh, the soybean crush margin is determined by the domestic price of soybean meal, the total imports, and the total feed production volume.

Soybean crushing is expected to increase in MY 2026/27 as feed production continues to grow. Recently, commercial poultry farms have expanded their operations, and some large private feed companies have begun contract farming for poultry production. Additionally, the use of formulated feed in aquaculture has increased.

Post forecasts MY 2026/27 whole soybean crushing at 2.35 million MT, up 2.2 percent compared to Post's MY 2025/26 estimate, on increased demand of soybean oil and soybean meal and higher imports as well. In MY 2025/26, Post estimates total soybean crushing at 2.3 million MT.

Food Use Consumption

In Bangladesh, human consumption of soybean products other than oil is minimal. Only a small portion of total soybean production is used for food preparation, mostly by some cottage type food processors. Farmers traditionally process soybeans into various food items, such as soy milk, soya halua (a dessert), soy curd, soya piazu (a fried snack made with flour, onions, and spices), and soy flour.

A few local entrepreneurs process domestically grown soybeans into different forms of soy powder and milk. Overall, the consumer demand for soybean-based food is negligible. Post forecasts MY 2026/27 food use consumption at only 5,000 MT.

Feed, Seed, Waste Consumption

For MY 2026/27, Post forecasts feed, seed, and waste consumption at 220,000 MT, up 10 percent from the MY 2025/26 estimate. Most locally grown soybeans are either supplied to the local feed industry or processed by local processors before being sold to the feed industry. These soybeans are used as full-fat soybeans in feed rations. Some feed companies also use imported soybeans as full-fat soybeans due to their higher quality. The annual estimated consumption of full-fat soybeans is around 200,000 MT. Additionally, some dairy farmers feed whole or broken soybeans to their animals, with an estimated annual usage of around 15,000 MT. Farmers prefer to keep their own seed for the next season. In a planting season, around 5,000 MT of soybeans are used as seeds by farmers.

For MY 2025/26 Post estimates feed, seed, and waste consumption at 200,000 MT, up 5.3 percent from Post's previous estimate on higher local production.

Trade

For MY 2026/27, Post forecasts total soybean imports at 2.4 million MT, up 4.3 percent from the current marketing year estimate, considering the rising demand for poultry, aqua, and dairy feed. Soybean meal makes up around 30 percent of feed ingredients used in Bangladesh. There is also always high demand for soybean oil for human consumption.

Post estimates MY 2025/26 soybean imports at 2.3 million MT. According to Bangladesh's National Board of Revenue (NBR), in the first eight months of MY 2025/26, Bangladesh imported 1.35 million MT of soybeans. During that period, U.S. exports were 1.13 million MT (84 percent compared to 48 percent in previous MY) while Brazil supplied 215,547 MT (16 percent) (Figure 1).

For MY 2024/25, Post revised total soybean imports to 1.82 million MT, based on final import data. Historically, Brazil and the United States are the major suppliers of soybeans into Bangladesh. However, one crushing company imported Canadian soybeans between November and December 2024 at a lower price.

Figure 1: Partner Country Soybean Exports to Bangladesh in MY 2024/25 and through February in MY 2025/26

Source: NBR

Bangladesh Industry Signed LOI to Purchase U.S. Soybean and Meal

On November 6, 2025, Meghna Group, City Group, and Delta Agrofood signed a letter of intent (LOI) with the U.S. Soybean Export Council (USSEC) to import at least 2 million MT of soybeans or USD 1 billion worth of soybeans, over a 12-month period starting from November 2025. On the same day, KGS Group and Mahbub Group also signed an LOI with USSEC to import 400,000 metric tons of soybeans and 200,000 metric tons of soybean meal over a 12-month period starting from November 2025.

Tariffs

Bangladesh imposes no import tariffs on soybeans to support the local crushing industry and ensure a supply of oil and soybean meal at lower prices. Per the GoB's Statutory Regulatory Order (SRO) 128-2020, most of the co-products of oilseeds and corn that are used as feed ingredients can be imported duty free. There are no quotas on oilseeds or related product imports. The following table shows the original customs duties and tax rates for various oilseeds and related products in Bangladesh.

Table 2: Bangladesh's Tariff Structure for Oilseeds, Soybean Meal, and Oil, FY 2025-26

Stocks

There are no government-held soybean stocks. For MY 2026/27, Post forecasts ending stocks at 105,000 MT. Post estimates MY 2025/26 soybean stocks at 100,000 MT. Crushers try to maintain 1-2 months of stocks. Usually, soybeans are stored in large silos located at the crushing facilities.

Rapeseed

Production

Bangladeshi farmers cultivate both rapeseed varieties (*brassica campestris* and *brassica napus*) and mustard (*brassica juncea*) varieties but refer to both interchangeably as “mustard.”

Agricultural research institutes in Bangladesh including BARI, BINA, and universities have released more than 20 “mustard” varieties. Among them, the most common rapeseed varieties are Tori-7, Sonil Sharisha (SS-75), Kallaynia (TS-72), Sampad, Agrani, BARI Sharisha-6, BARI Sharisha-7, BARI Sharisha-8, BINA Sharisha-3, BINA Sharisha-4, SAU Sharisha-1, and SAU Sharisha-2. The most popular mustard varieties are Rai-5, Daulat, Sambal, BARI Sharisha-10, BARI Sharisha-12, and BARI Sharisha-16. All those varieties are marketed and consumed as “mustard” in Bangladesh. Bangladesh also imports rapeseed and blends it with locally produced “mustard” during crushing to produce “mustard oil” for sale to the local market. Therefore, this report combines the production, marketing, and consumption data of both rapeseed and mustard.

Rapeseed/mustard requires cool temperatures to grow, thus it is cultivated in the *rabi* season. The best growth of rapeseed/mustard occurs at 12-25 degrees Celsius. In Bangladesh, sowing starts in the middle of October, but in some parts of the country sowing is delayed after late harvest of previous crop (T. *Aman* rice). As winter is very short in Bangladesh and temperatures start rising in February, harvest should be completed by mid-February to achieve optimum yield. The average yield of mustard/rapeseed in Bangladesh is about 1.3 MT per hectare.

For MY 2026/27, Post forecasts the rapeseed/mustard harvested area at 1.05 million hectares and production at 1.36 million MT, up 5 percent and 6.25 percent, respectively over the MY 2025/26 estimates. In MY 2025/26, rapeseed acreage fell short of the DAE’s target as many farmers shifted to potato cultivation, anticipating higher prices. However, an oversupply of potatoes led to a price drop, causing significant losses for many farmers. Post believes that in MY 2026/27, some farmers will return to mustard cultivation.

Based on DAE’s crop production data and Post observations, Post reduced the MY 2025/26 rapeseed/mustard harvested area estimate to 1 million hectares and production to 1.28 million MT due to the increase in potato acreage.

Figure 2: Mustard Harvested Area in Bangladesh

Source: DAE

Trade

Bangladesh imports rapeseed to blend with mustard seed during the crushing process to produce oil, that is then marketed as mustard oil. For MY 2026/27, Post forecasts rapeseed imports at 450,000 MT, a 12.5 percent increase from the current MY estimate, driven by rising demand for mustard oil. Rapeseed imported from Canada, commonly referred to as canola seed, is also crushed separately, and the resulting oil is marketed as canola oil. Recently, one of the leading oilseed crushers in Bangladesh initiated commercial production and marketing of canola oil. This processor is expected to continue expanding canola oil production and marketing, which is likely to contribute to higher rapeseed imports in MY 2026/27.

Post estimates MY 2025/26 rapeseed imports at 400,000 MT, which is 25 percent higher than the USDA official estimate due to lower domestic mustard production. According to Trade Data Monitor (TDM), Bangladesh imported 167,737 MT of rapeseed during the first four months of MY 2025/26, all of which originated from Canada.

Post estimates MY 2024/25 rapeseed imports at 421,000 MT based on the final trade number from TDM. Per TDM, in MY 2024/25, Bangladesh imported 53 percent of rapeseed from Canada, 46 percent from Australia and only 1 percent from Ukraine (Figure 3).

Figure 3: Origin of rapeseed imports to Bangladesh in MY 2024/25

Source: TDM

Consumption

Crush

Mustard crushing facilities in Bangladesh are primarily small to medium scale operations scattered across the country. These facilities process both domestically grown mustard seeds and imported rapeseed to produce mustard oil. Many traditional mustard crushing units still use cold-press methods, while larger mills have adopted modern mechanical extraction. However, there is no available data on the total mustard seed crushing capacity in Bangladesh.

For MY 2026/27, Post forecasts rapeseed/mustard crushing at 1.65 million MT, which includes domestically produced rapeseed/mustard and imported rapeseed. This forecast is based on expectations of a good mustard harvest next season and higher imports of rapeseed (Canola seed) from Canada. Post slightly decreases its MY 2025/26 crushing estimate to 1.6 million MT, based on the lower domestic production of mustard.

Food Use Consumption

For MY 2026/27, Post forecasts food use of mustard seed at 28,000 MT. Traditionally, mustard seed is used in making special types of curry in Bangladesh. Mustard paste/sauce known as *kashundi* is also popular in Bangladesh. Some private food processing companies are producing *kashundi* at a commercial scale.

Feed, Seed, and Waste Consumption

Post forecasts MY 2026/27 feed, seed, and waste consumption of whole mustard/rapeseed at 120,000 MT. Some feed companies use a very small amount of rapeseed in feed preparation based on their feed formula. However, a portion of the mustard/rapeseed is used as planting seed for the following season. Rapeseed/mustard harvest, threshing and drying are done manually in most of the areas in Bangladesh, and post-harvest loss of rapeseed/mustard is high. For MY 2025/26, Post's mustard feed, seed, and waste consumption estimate is 110,000 MT.

Stocks

Post forecasts MY 2026/27 rapeseed/mustard stocks at 153,000 MT, on increased production and higher imports. There are no public warehouses to stock rapeseed/mustard. The mustard crushing mills maintain their own stocks with a couple of months' supply. Many farmers also store mustard seeds for household use, keeping a few months' supply at home. Some traders stock mustard seeds in private warehouses, primarily purchasing from farmers during the harvest season and selling when market prices rise. Farmers, traders, and small-scale traditional crushers store mustard/rapeseed in 50 kg bags, while medium- and large-scale crushers use silos for storage. Post estimates MY 2025/26 rapeseed/mustard stocks at 141,000 MT.

MEALS SITUATION AND OUTLOOK

The common oilseed meals produced and utilized in Bangladesh are soybean meal and rapeseed/mustard meal. The feed industry uses them as major protein sources in their feed formulations. Alongside local production, Bangladesh also imports soybean meal and rapeseed/mustard meal from various countries. With the increasing demand for formulated feed in the poultry, cattle, and aquaculture sectors, the demand for oilseed meals is on the rise.

Soybean Meal

Production

For MY 2026/27, Post forecasts soybean meal production at 1.88 million MT, up 4.1 percent from the current marketing year estimates, on higher volume of soybean imports and crushing.

For MY 2025/26, Post's soybean meal production estimate is 1.8 million MT based on the soybean import data and insights from the crushing industry.

Feed Consumption

Post forecasts MY 2026/27 soybean meal consumption in the feed industry at 2.9 million MT, assuming a stable price and supply situation. Industry contacts noted that with the current demand for meat, eggs, and milk, the poultry, aquaculture, and dairy sectors are expected to continue growing, with the feed industry projected to produce at least 10 percent more feed annually for commercial farmers through 2030. Based on the rising demand for feed production and an increased supply of soybean meal, Post estimates MY 2025/26 soybean meal consumption at 2.7 million MT.

Feed Industry Overview

Bangladesh's feed industry has experienced sustained growth for more than a decade, driven largely by the expansion of the poultry, aquaculture, and livestock sectors. According to the Feed Industry Association of Bangladesh (FIAB) and the Bangladesh Poultry Industries Central Council (BPICC), approximately 150 registered companies are engaged in the production and marketing of commercial feed for poultry, aquaculture, and dairy cattle. In addition to these formal producers, numerous unregistered small and cottage-type feed manufacturers operate throughout the country, often producing feed using their own formulations that frequently do not meet standard quality requirements such as nutritional composition (crude protein, metabolize energy, fat etc.), amino acid, mineral content etc.

Post forecasts total feed production in MY 2026/27 at 7.7 MT. Poultry feed accounts for the largest share, about 70 percent, while the remainder consists of aquaculture and cattle feed. Common feed ingredients used in Bangladesh include fish meal, distillers dried grains with solubles (DDGS), extruded full-fat soybeans, broken rice, rice polish, rapeseed/mustard meal, corn gluten meal, coarse limestone, and de-oiled rice bran.

Status of the Livestock and Poultry Sector

The livestock sector plays a significant role in Bangladesh's economy and rural livelihoods. It contributes 1.81 percent to the national Gross Domestic Product (GDP) and accounts for 16.54 percent of the agricultural GDP, indicating its substantial importance within the agriculture sector. The sector is also experiencing steady expansion, with a GDP growth rate of 3.19 percent. According to data from the Department of Livestock Services (DLS), the production of milk, meat, and eggs has continued to grow for more than a decade (Figure 4). However, there was a slight decline in meat production in FY 2024–25.

Figure 4: Bangladesh's Milk, Meat, and Egg Production

Source: Livestock Economy, DLS, 2025

Per DLS data, in FY 2024-25, the number of cattle, goat, sheep, and poultry birds also increases over the last decade (Figure 5). Every year there is slight increase in demand for cows, sheep, and goats during Eid-ul-Adha.

In Bangladesh, the livestock sector is predominantly composed of smallholder farmers, who typically manage 1–5 animals on their backyard. Cattle and goats are the main sources of meat, with the beef and mutton industry largely supported by these small-scale producers rather than commercial farms. Poultry production is more commercialized, but many rural households still rear backyard chickens and ducks for eggs and meat. Overall, most of the meat and milk production remains in the hands of millions of small-scale livestock farmers across the country.

Figure 5: Livestock and Poultry Population in Bangladesh

Source: Livestock Economy, DLS, 2025

Fisheries Production

Aquaculture is a vital source of livelihood for over five million households across Bangladesh, with fish remaining a traditional staple in the diet. Many farmers have adopted semi-intensive cultivation, which combines elements of traditional extensive farming and intensive practices through controlled feeding, improved water management, and moderate stocking densities. This approach allows for higher production and better returns while keeping costs manageable.

The fisheries industry has been experiencing steady growth and increasingly relies on feeds containing high levels of soybean meal and DDGS (Figure 6). This is rapidly growing sector, with both small pond-based farmers and larger commercial operators contributing to significant fish production, particularly carp and tilapia. Soybean meals serve as a key protein source in floating aquafeed, supporting improved fish growth and overall productivity.

Figure 6: Fish Production in Bangladesh

Source: Yearbook of Fisheries Statistics of Bangladesh, 2024

Industrial Consumption and Food Use

There is no industrial use of soybean meal in Bangladesh.

Trade

For MY 2026/27, Post forecasts soybean meal imports at 1.1 million MT, slightly higher than the MY 2025/26 estimate, expecting continued demand in the feed industry. Preferred sources include Brazil, Argentina, the United States, and India.

Smaller feed producers import soybean meal in combined shipments to obtain lower prices than locally produced soybean meal. The stabilized exchange rate has made it easier for small and medium-sized companies to open LCs.

Post's estimate of MY 2025/26 soybean meal imports remains at 1 million MT. Per NBR data, in the first eight months of MY 2025/26, Bangladesh imported 721,000 MT of soybean meal with Brazil supplying over 62 percent (446,050 MT), USA 22 percent (155,720 MT), and Argentina 16 percent (118,861 MT) (Figure 7).

Figure 7: Origin of Soybean Meal Imports in Bangladesh in MY 2025/26 (First Eight Months; July-February)

Source: NBR

Post sources indicated that feed millers favor imported soybean meals because they offer higher quality, superior protein content, and optimal moisture levels compared to locally produced meal. Additionally, importing soybean meal provides a cost advantage of 2–3 Taka per kilogram (\$0.024 per kilogram) for feed producers.

Stocks

Bangladesh does not have any government-owned facilities for storing soybean meal. Storage is primarily managed by private soybean crushers and large feed mills, with feed millers typically maintaining stocks sufficient for 1-2 months of use.

Post forecasts soybean meal stocks for MY 2026/27 at 388,000 MT, a 24 percent increase over the MY 2025/26 estimate, driven by higher soybean crushing and increased imports. For MY 2025/26, Post estimates soybean meal stocks at 313,000 MT.

Rapeseed Meal

Production

Post forecasts MY 2026/27 rapeseed/mustard meal production at 930,000 MT, up 3.3 percent from the MY 2025/26 estimate on higher crushing. With high domestic production of rapeseed/mustard along with some imported seed, the industry is expected to sustain increased levels of crushing. As the overall demand for edible oil continues to rise in Bangladesh, the demand for mustard oil is also increasing. This growth will lead to a higher volume of mustard seed crushing, resulting in higher production of rapeseed/mustard meal in MY 2026/27.

In MY 2025/26 Post estimates rapeseed/mustard meal production at 900,000 MT.

Trade

Along with the domestic production of rapeseed/mustard meal, Bangladesh imports a substantial amount every year, mostly from India. For MY 2026/27, Post forecasts rapeseed/mustard meal imports at 400,000 MT based on feed industry demand. The feed industry uses 4-5 percent rapeseed meal in feed rations. However, the amount varies on the price of rapeseed versus other relevant feed ingredients.

Post estimates MY 2025/26 rapeseed/mustard imports at 400,000 MT. During the first three months of MY 2025/2, approximately 52,000 MT of rapeseed meal was imported from India, as per TDM. In MY 2024/25, the total rapeseed/mustard imports were 384,000 MT from India only.

Feed Consumption

Rapeseed/mustard meal has long been used in Bangladesh as a feed ingredient for livestock, particularly cattle. Traditionally, farmers fed raw rapeseed/mustard meal directly to cattle or mixed it with rice straw before feeding. However, with the expansion of the commercial feed industry and the increasing use of formulated feed, rapeseed/mustard meal is now widely incorporated into prepared poultry, cattle, and aquaculture feed. Depending on the formulation and combination of ingredients, rapeseed/mustard meal typically constitutes about 4-5 percent of different feed rations.

For MY 2026/27, Post forecasts rapeseed/mustard meal consumption for feed at 1.3 million MT, with the majority utilized by the commercial feed industry. Post also revises the MY 2025/26 estimate to 1.3 million MT, reflecting lower-than-expected imports.

Industrial Consumption

Rapeseed/mustard meal is a good source of organic fertilizer with nitrogen, phosphorus, and potassium that promote robust plant growth. With the development of urban and rooftop farming practices in Bangladesh, the demand for rapeseed/mustard meal has increased over the last

decade. Some farmers also use it as soil additive for cultivating high value crops. Post forecasts MY 2026/27 industrial consumption of rapeseed/mustard meal at 15,000 MT. For MY 2025/26, Post estimates rapeseed/mustard meal industrial consumption at 15,000 MT, on higher demand for fertilizer in urban areas.

Stocks

Feed millers in Bangladesh typically maintain rapeseed/mustard meal stocks for only a few months to meet short-term feed production needs. There are no government-held reserves of rapeseed/mustard meal. In addition to feed mills, local mustard seed crushers also keep limited inventories, which they supply to nearby feed producers and cattle farms. Rapeseed/mustard meal is generally stored in sacks for ease of handling and transport.

Post forecasts MY 2026/27 ending stocks at 93,000 MT. For MY 2025/26, Post estimates rapeseed/mustard meal ending stocks at 98,000 MT.

OILS SITUATION AND OUTLOOK

In Bangladesh, mustard and sunflower are the primary oilseeds crushed domestically for edible oil production. However, several other edible oils are widely consumed in the country, including palm oil, soybean oil, and rice bran oil. Domestic oilseed production meets only about 10 percent of the country's total edible oil demand, with the remaining supply fulfilled through imports of either crude edible oil (soybean and Palm oil) or oilseeds for local crushing. In Bangladesh, refined palm oil is often used as a substitute for soybean oil for cooking purposes.

The country's annual edible oil requirement is approximately 4.8 million MT. Of this total, palm oil accounts for about 52 percent, followed by soybean oil at 36 percent, mustard oil at 10 percent, and other edible oils making up the remaining two percent. Palm oil dominates the market largely because of its wide availability, extensive use in the food processing industry, and lower price than to other edible oils.

Soybean Oil and Palm Oil

Production

In Bangladesh, soybean oil production relies primarily on imported soybeans, as domestically produced soybeans are generally not used for oil extraction. The crushing process yields both soybean oil and soybean meal, allowing processors to diversify their output. However, soybean crushing requires substantial large-scale infrastructure and is sensitive to fluctuations in local prices for both oil and meal.

Currently, the crushing sector supplies about 20 percent of the country's soybean oil, while the remaining share is imported as crude soybean oil and refined locally. More than ten edible oil refineries operate in Bangladesh. Major refiners include Bangladesh Edible Oil Ltd. (BEOL), City Group, Meghna Group, T.K. Group, Bashundhara Multi Food Products, Smile Food Products, Sena Edible Oil Industries, Vott Oil Refineries Ltd., and Delta Agro Food Industries. Compared to crushing, refining imported crude soybean oil often involves higher processing costs due to import tariffs and value-added tax (VAT) applied during processing.

Post forecasts MY 2026/27 soybean oil production at 430,000 MT, driven by increased soybean imports. For MY 2025/26, Post estimates production at 420,000 MT, reflecting higher soybean imports and increased crushing activity, representing a 25 percent increase from previous marketing

Bangladesh does not produce any palm oil.

Prices

Edible Oil Price Volatility Continues

In Bangladesh, most people use soybean oil and palm oil for cooking. These two oils make up about 87 percent of all the cooking oil people buy. Starting in July 2021, the prices of all cooking oil started to rise. When Russia invaded Ukraine in February 2022, the situation worsened, and by May 2022, the prices of soybean oil and palm oil reached record highs. In the first half of 2024 the edible oil prices came down slightly, but starting in September 2024 the price rose again.

To regulate the edible oil market, the GoB holds periodic meetings with oil traders and refiners to set a maximum retail price (MRP) for bottled soybean and palm oil. However, there are no price regulations for unbottled soybean or palm oil.

As of the second week of March 2026, the GoB set the price of bottled soybean oil at BDT 195 (\$1.58) per liter and “super” palm oil at BDT 165 (\$1.34) per liter. In contrast, the price of unbottled soybean oil reached BDT 193 (\$1.57) per liter. Super palm oil is used for cooking purposes and

The price of unbottled palm oil has reduced slightly since November 2024 down to BDT 155 (\$1.30) per liter in March 2025 (Figure 8).

Figure 8: Average Retail Price of Unbottled Soybean Oil and Palm Oil (2021-26)

Source: TCB, 1 USD = 123 BDT

Trade

Soybean Oil Imports Rise

For MY 2026/27, Post forecasts soybean oil imports at 1.5 million MT, a 15 percent increase from the MY 2025/26 estimate, assuming continued strong demand for soybean oil both in industrial and food use.

According to NBR, in the first seven months of MY 2025/26, approximately 866,000 MT of soybean oil had been imported. Bangladesh imports most of its crude soybean oil from South America. In the first seven months of MY 2025/26, Bangladesh imported 71 percent (614,335 MT) of soybean oil imported from Argentina, 10 percent (87,823 MT) from Brazil, 6 percent (55,088 MT) from Paraguay, and 11 percent (91,161 MT) from China (Figure 9).

In MY 2024/25, Post adjusted the total soybean oil imports amount at 1.65 million based on the final trade numbers from the NBR and the Central Bank of Bangladesh.

Figure 9: Origin of Soybean Oil Imports into Bangladesh in MY 2025/26 (First Eight Months; July-February)

Source: NBR

Palm Oil Imports Rise

Post forecasts MY 2026/27 palm oil imports at 2.65 million MT, an increase of 1.9 percent from Post's MY 2025/26 estimate, assuming higher demand for palm oil in both industrial and food uses.

In MY 2025/26, Post estimates palm oil imports at 2.6 million MT. The demand for palm oil has increased as it has a lower price compared to soybean oil. During the first seven months of MY

2025/26, Bangladesh imported approximately 1.75 million MT of palm oil. Indonesia was the dominant supplier, accounting for 97 percent of total imports, while the remaining 3 percent originated from Malaysia.

In MY 2024/25, Post adjusted the total palm oil imports at 2.54 million MT based on the revised trade numbers from NBR and Bangladesh's Central Bank.

Bangladesh also exports small amounts of palm oil to neighboring countries including India and Nepal. For MY 2026/27, Post forecasts palm oil exports at 5,000 MT. Post estimates MY 2025/26 palm oil exports at 5,000 MT.

Consumption

Food Use Domestic Consumption Rises

Bangladesh's total annual demand for edible oil is estimated at about 5 million MT. Over the past decade, this demand has increased steadily, driven by rising household consumption and the expansion of restaurants and fast-food establishments, according to various news sources. Changing dietary habits among younger consumers, particularly the growing preference for ready-to-cook and fried foods, has further contributed to the higher consumption of edible oils. In the Bangladesh market, soybean oil and palm oil generally act as substitute products; however, consumer preference varies by income level. Middle- and high-income consumers typically prefer soybean oil, while lower-income consumers tend to choose palm oil due to its lower price, and palm oil is also more widely used in food processing. In recent years, mustard oil has also gained popularity among many households as an alternative to soybean oil.

Post estimate per capita vegetable oil consumption in Bangladesh at around 24 kg per year based on the total annual domestic consumption of soybean oil, palm oil, and mustard oil.

There is no consumption of vegetable oil for biofuel production in Bangladesh. However, there are some industrial uses of palm oil including lubricants, inks, cosmetics, and soaps. Around 200,000 to 230,000 MT of palm oil goes to industrial use annually.

For MY 2026/27, Post forecasts soybean oil and palm oil total domestic consumption at 1.87 million and 2.63 million MT, respectively. Post estimates MY 2025/26 soybean oil consumption at 1.76 million MT. Post's MY 2025/26 palm oil consumption estimate is 2.52 million MT. Post also adjusted MY 2024/25 total domestic consumption of soybean oil and palm oil at 1.65 million MT and 2.4 million MT, respectively, based on updated import data from the Bangladesh NBR and Central Bank.

Stocks

Post forecast MY 2026/27 soybean oil and palm oil ending stocks at 386,000 MT and 387,000 MT, respectively, on higher volume of imports.

Post also estimates MY 2025/26 soybean oil and palm oil ending stocks at 329,000 MT and 372,000 MT, respectively.

Rapeseed Oil

Production

In Bangladesh, edible oil extracted from rapeseed and mustard seeds is commonly marketed as “mustard oil.” For MY 2026/27, Post forecasts rapeseed/mustard oil production at approximately 670,000 MT, based on the forecast of higher domestic production of rapeseed/mustard as well as continued imports. The mustard oil sector is supported by a number of private companies that process the seeds and distribute bottled mustard oil nationwide, ensuring availability across urban and rural markets. Traditionally, mustard oil remains one of the staple cooking oils in Bangladeshi households, widely used for traditional culinary purposes, contributing significantly to both the edible oil market and the local agricultural economy.

For MY 2025/26, Post estimate of rapeseed/mustard oil production to 650,000 MT, as same as the previous year based on the increased import of rapeseed.

Major market players in the rapeseed/mustard oil sector are Partex Group, Pran Foods Limited, City Group, ACI, Nabil Group, Square Group, Meghna Group, and Orion Group. These companies crush imported rapeseed with locally produced mustard seed. There are many local mustard oil crushing mills that blend domestically produced mustard seed with imported rapeseed to extract oil for local sale. According to contacts, more than 50 percent of domestically produced rapeseed/mustard seed goes to these local crushing mills. Bangladesh does not import any rapeseed/mustard oil.

Trade

Bangladesh does not import rapeseed/mustard oil. However, it exports a substantial amount, primarily to Middle Eastern countries, including Bahrain, Saudi Arabia, Qatar, and Malaysia as there are a large number of Bangladeshi people living. Post assumes that the Bangladeshi community and overseas workers living in the Middle East will demand more mustard oil in the coming years. For MY 2026/27, Post forecasts rapeseed/mustard oil exports at 220,000 MT, as same as the estimates of MY 2025/26. Based on TDM data, in the first five months in MY 2025/26, Bangladesh exported around 100,000 MT of rapeseed/mustard mostly to Bahrain.

Consumption

Many Bangladeshi consumers prefer mustard oil for cooking and food preparation purposes over soybean and palm oil due its strong flavor and aroma. A few years ago, the price of mustard oil was almost double the price of soybean oil. However, greater production of mustard oil has brought down its price. There is no government regulation of the price of mustard oil. The retail price of unbottled mustard oil varies across different districts. Similarly, the price of bottled

mustard oil fluctuates depending on the brand or local company. As of March 2026, the price range for unbottled mustard oil is approximately BDT 200-220 (\$1.63 - 1.79) per liter, while bottled mustard oil typically ranges from BDT 250-350 (\$2.03-2.85) per liter. Thus, mustard oil is currently expensive compared to soybean oil, reducing the consumption of mustard oil in Bangladesh.

In MY 2026/27, Post forecasts total domestic consumption of rapeseed and mustard oil at 470,000 metric tons, with the vast majority used for food purposes. For MY 2025/26, Post estimates consumption at 450,000 metric tons, representing a 10 percent decline compared to the previous year's estimate.

Stocks

Post forecasts MY 2026/27 rapeseed/mustard oil ending stocks at 30,000 MT, a 10,000 MT less than MY 2025/26. Typically, local mustard oil crushers do not store oil for more than two to three months. However, large-scale oil producers maintain some stock, either in bottles or oil containers.
