

Required Report: Required - Public Distribution

Date: March 04, 2026

Report Number: TS2026-0002

Report Name: Oilseeds and Products Annual

Country: Tunisia

Post: Tunis

Report Category: Oilseeds and Products

Prepared By: FAS Tunis

Approved By: Benjamin Rau

Report Highlights:

Tunisian MY 2026/27 soybean imports are expected to reach 595,000 MT, compared to 580,000 MT in MY 2025/26 as demand for animal feed increases slightly with growing demand for proteins driven by a stronger tourism sector. Tunisian olive oil exports are forecast to drop to 240,000 MT in MY 2026/27, compared to 400,000 MT in MY 2025/26 reflecting the alternating high and low fruit bearing cycle of olive production.

Area Harvested/Production: Tunisia does not produce soybeans. Although the Ministry of Agriculture encourages Tunisian producers to diversify into rapeseed and sunflower crops, there are no formal programs to support diversification. As a result, Tunisian oilseed production is focused on the olive industry.

Consumption: Soybean crushing in Tunisia is done by one company. For MY 2026/27, Post expects Tunisia's crushing facility demand to slightly increase compared to MY 2025/26 and MY 2024/25. This is due in part to an anticipated small increase in Tunisia's food service sector, (a significant poultry, beef, and dairy consumer). Much of this growth is driven by a tourism sector that exceeded its pre-covid pandemic record in 2025 with over 11 million visitors. Soybean total consumption in MY 2024/25 is slightly increased to reflect a touch higher crush in MY 2024/25 based on final industry numbers. Tunisian feed millers report that the industry is estimated to direct more soybeans to the production of full fat soybean and express soybean meal (direct feed use) in MY 2025/26 and in MY 2026/27, as production capacities and demand for full fat soybean and express soybean meal is growing. Indeed, the third largest feed miller invested in a new soybean pressing unit that started production in MY 2025/26 and will reach its full capacity in MY 2026/27.

Stocks: Industry strives to maintain at least 30 processing days of storage, or about 45,000 MT. Industry sources also confirm ending stocks in MY 2024/25 were 30,000 MT.

Trade: Post maintained the MY 2024/25 import based on revised and finalized trade numbers. The MY 2025/26 import estimate reflects crush and final consumption numbers. The MY 2026/27 import forecast reflects an anticipated increase in consumption compared to MY 2025/26. In MY 2024/2025, Tunisia soybean imports were 60% from Brazil, 36% from the U.S., and 4% from Ukraine.

Tunisian importers typically import based on price and availability. However, Tunisia's soybean crusher reports their satisfaction with U.S. soybean quality and stated their willingness to pay premiums for U.S. soybeans over products from competing origins even when prices are slightly lower from other origins.

Total Distribution (1000 MT)	524	516	547	546	571

Production: No significant changes are currently seen or expected in extraction rates. Soybean meal production and ending stocks in MY 2024/25 are revised lower based on industry final production reports.

Consumption: In MY 2024/25 Post decreased soybean meal consumption to balance production and end stocks with industry final numbers. Post estimates soybean meal consumption to increase in MY 2025/2026 and in 2026/2027 compared to MY 2024/25. This increase reflects the assumption of a continued increase in the tourism industry's demand for animal origin proteins and assuming normal population growth. Note that 70 percent of soybean meals are destined for the poultry and egg sectors.

Table 3: Meals on a Soybean Meal Equivalent Basis

Meals on a Soybean Meal Equivalent Basis (1,000 MT)					
	Description	Conversion Factor	Marketing Year		
			2022/23	2023/24	2024/25

Source: (1) PSD, (2) Industry, (3) Source: Trade Data Monitor, LLC derived data by calculating imports/exports by exporters or importers.

Stocks: Tunisia's feed mills and crushing facility each target 30 days of soybean meal stocks. Post decreases soybean meal ending stocks to reflect industry's final number for MY 2024/25. In MY 2025/26 Post decreased soybean meal ending stocks to balance an estimated higher total consumption.

Trade: Soybean meal imports in MY 2026/27 are forecast to slightly increase compared to MY 2025/26 to accommodate a projected consumption increase.

Production: MY 2026/27 olive oil production is forecast at 250,000 MT which is a decrease from MY 2025/26, reflecting the alternating high fruit bearing cycle which had high production that year. This is in line with the 10-year average for low fruit bearing years. In the last low fruit bearing year, MY 2024/2025, production was boosted by good rainfall and adequate temperatures. Post currently estimates MY 2025/26 production at 470,000 MT, based on official and industry sources and USDA field visits. The 2025/26 harvest is ongoing (October 2025 - February 2026). Tunisia's olive area accounts for one-third of the country's total arable land, and area is expected to continue increasing in coming years (see policy section). The bulk of the olive harvest is processed into various grades of oil by 930 private olive mills scattered throughout the production area.

Soybean oil production in MY 2024/25 is revised slightly higher based on industry-reported final data. In 2025/26 soybean oil production is maintained to reflect an increase in crushing compared to MY 2024/25 with an estimated stable extraction rate.

Consumption: Given current policies, Post does not see significant changes to per capita consumption of soybean or palm oil. Soybean and corn oil are the most popular cooking oils with prices subsidized by the government to ensure their affordability on the retail market (see policy section). Palm oil is not well perceived by consumers and is generally limited to the food manufacturing sector.

Stocks: Industry sources confirm soybean oil ending stocks in MY 2024/25 were 12,000 MT.

Table 7: Total Vegetable Oil Food Use

Total Non-Olive Vegetable Oil Food Use (1,000 MT)				
	Description	Marketing Year		
		2022/23	2023/24	2024/25

	Soybean Oil	0	0	0
Balance	Non-Olive Veg Oil	298	266	232

Source: (1) PSD, (2) Trade Data Monitor, LLC derived data by calculating imports/exports by exporters or importers.

Domestic olive oil prices have decreased for local consumers due to higher production in MY 2025/26. The average domestic price for Tunisian olive oil is currently \$4.15 per liter, compared to \$4.37 the same time last year. In MY 2026/27 olive oil consumption is forecast to decrease compared to MY 2025/26 based on a projected higher domestic price due to lower production.

Trade: Tunisia's primary export markets for olive oil are Europe and the United States (60 percent and 28 percent respectively), with 13 percent of total production sold in bottles in MY 2024/25. However, the volume of bottled olive oil exports is increasing, as per the government priority to substitute more lucrative sales of branded products in place of bulk exports to intermediary processors in the EU. Most exports are facilitated by the National Oil Board (ONH).

Soybean oil is Tunisia's largest vegetable oil import, followed by palm, corn, and sunflower oils. Soybean, sunflower, and corn oil are imported crude, and supported by an advantageous tax structure (see policy section below). However, palm oil is generally imported refined. Most refined corn oil and significant volumes of refined soybean oil are then re-exported. While Libya is a major buyer of Tunisia's refined and price-controlled vegetable oils, exact export volumes are difficult to estimate.

Figure3: Soybean Oil Exports to Tunisia (MT)

Source: Trade Data Monitor, LLC

Figure 4: Palm Oil Exports to Tunisia (MT)

Source: Trade Data Monitor, LLC

Policy: There have been no major changes in vegetable oil policy, and Tunisia maintains the following key objectives with regards to the sector:

1. To increase annual average production of olive oil from 215,000 MT to 300,000 MT by 2035 through (1) a plan to replace aging olive trees (representing 20 percent of olive trees) and (2) plans for new plantations in northwest Tunisia.

2. To increase olive tree yields from a low average of 0.1 MT of olive oil per hectare to no less than 0.14 MT per hectare through improvement of olive tree cultivation techniques and a national olive disease protection program.
3. To mitigate the large disparity of olive oil production during drought years, the government targets increasing irrigated areas of olive trees from 130,000 HA to 170,000 HA. (Droughts occur two out of every five years on average). Expansion of irrigation would increase olive oil production from irrigated orchards to 150,000 MT and guarantee a minimum level of production during drought years.
4. To promote olive oil exports, a major source of the country's hard currency earnings.
5. To fulfill most of the domestic demand for imported vegetable oils at the lowest cost possible.
6. To continue subsidizing vegetable oil purchased by the state-run National Oil Board (ONH) to maintain relatively low market prices at the retail level [note: the Compensation Fund (Caisse Generale de Compensation) writes off losses incurred by ONH resulting from selling at prices below purchase costs].
7. To transition vegetable oil imports from ONH to private-run refiners via a refining quota system.

To maintain affordable prices of vegetable oils for consumers, the government continues to maintain reduced taxes and no VAT on a list of edible oils (e.g., palm, soybean, corn, and sunflower) through the application of Decree 2014-002 of January 7, 2014.
