Date: April 16, 2026

Report Number: RP2026-0011

Report Name: Oilseeds and Products Annual

Country: Philippines

Post: Manila

Report Category: Oilseeds and Products

Prepared By: Tricia Joy F. Arroyo

Approved By: Herpin Rochet Jateng

Report Highlights:

FAS Manila forecasts soybean meal (SBM) imports in Marketing Year (MY) 2026/27 to rise modestly, reflecting higher feed demand from the broiler, layer, aquaculture, pet food, and dairy industries, even as African swine fever (ASF) continues to limit hog feed use relative to pre-ASF levels. Copra crush is forecast to increase in MY 2026/27 on improved copra availability, resulting in higher coconut oil production for both food use and industrial applications, including coconut methyl ester (CME) for biodiesel blending. Copra meal output is forecast to increase in MY 2026/27, but higher prices and nutritional limitations relative to SBM are forecast to reduce its share in feed rations and support increased exports. Palm oil production and imports in MY 2026/27 are forecast to increase to supplement food and industrial demand alongside domestic coconut oil.

Executive Summary

FAS Manila forecasts soybean meal (SBM) imports in Marketing Year (MY) 2026/27 to rise modestly, in line with higher feed demand from the broiler, layer, aquaculture, pet food, and dairy industries. SBM remains the primary crude protein in compound feed, while domestic SBM production stays limited to a single crusher supplying its own integrated food and feed operations. Whole soybean imports continue to support growing demand for soy-based foods and beverages, including soy sauce, soy drinks, and tofu.

FAS Manila forecasts higher copra and coconut oil production in MY 2026/27, supported by improved rainfall, tree recovery, and productivity gains under the Coconut Farmers and Industry Development Plan (CFIDP). Copra crush within the existing milling capacity will increase coconut oil production to

meet rising food use and for biodiesel blending needs. Copra meal production also increases, but both higher prices and nutritional limitations relative to SBM limit its role in feed, with a significant share exported, mainly to South Korea.

FAS Manila forecasts palm oil production to increase in MY 2026/27 with higher fresh fruit bunch (FFB) output and continued investment in oil palm development in Mindanao. Domestic food and industrial demand for palm oil expands, as palm oil remains a cost-competitive substitute for coconut oil in cooking and is widely used in products such as soap, cosmetics, and pharmaceuticals. Imports of refined palm oil continue to supply most domestic needs, while exports of crude palm oil remain a smaller, steady component of trade.

OILSEEDS SECTION

SOYBEAN

The Philippines relies on imported soybeans to meet local demand for food and animal feed, due to limited domestic production. Soybeans are generally considered more cost-effective to import than to produce locally.

Table 3: Soybean: Production, Supply, and Distribution

Production

FAS Manila forecasts local soybean production to remain under 1,000 metric tons (MT) in Marketing Year (MY) MY 2026/27. Domestic soybean production has declined by an average of 27.5 percent year-on-year from 615.6 to 318.3 MT in Calendar Year (CY) 2023 to 2025. This decline reflects several factors, including competition from other crops, lower import costs compared to domestic production, and difficulties in maximizing yields in a tropical climate where soybean diseases develop more rapidly in high-humidity conditions. According to industry contacts, soybeans are generally more expensive to produce in the Philippines than to import, reducing incentives for local farmers to plant soybeans.

Table 4: Soybean Regional Production in the Philippines (MT)				
Region	2023	2024	2025	Percentage Change, 2025/2024
Caraga	466.30	376.04	193.94	-48.4

Average growth rate, 2023-2025	-27.5
--------------------------------	-------

Source of basic data: [Philippine Statistics Authority](#)

Area Harvested

FAS Manila forecasts area harvested to remain under 1,000 hectares (ha) in MY 2026/27, but improving by an average of 1.3 percent year-on-year from 376.0 to 385.9 ha from CY 2023 to 2025. The Philippines is a large exporter of banana from the Mindanao area; meanwhile, local yellow corn has strong marketability in Mindanao for domestic feed and industrial applications.

Despite remaining in competition with other crops in the Mindanao area, soybean area harvested/planted expanded in CY 2025, supported by the Philippine Department of Agriculture's (DA) regional initiatives to [revive and promote local soybean production](#), such as techno-demo projects and the promotion of bio-fertilizer use in the Davao Region. Other industry initiatives include the [production of new seed varieties from the United States and Canada](#), which are sold to a limited number of farmers in Central Mindanao under general input-financing arrangements, including "[Plant-Now-Pay-Later](#)" and "[Buy-Back](#)" [schemes](#). Most of the soybean area in the Philippines are in Mindanao, with Caraga region being the largest. Other areas in Mindanao include Northern Mindanao, Davao, Soccsksargen, and Zamboanga Peninsula regions. There is minimal soybean area in Luzon and Visayas, located in the Negros Island and Ilocos regions, respectively.

Soybean water needs are most critical during flowering and pod filling, rather than at planting; in the Philippines, consistent with the [Philippine Department of Agriculture – Agricultural Training Institute's soybean production guide](#), reproductive growth is encouraged during the short-day period from November to January, followed by late pod development and maturation into March. Based on the [USDA-Foreign Agricultural Service Global Agricultural & Disaster Assessment System](#), November-January 2026 was drier than the same period in 2025, and January-March 2026 was also relatively dry in Mindanao. These drier reproductive and late pod development periods coincided with weaker yields and a forecast production decline in MY 2026/27 despite slightly higher area harvested.

**Figure 1: Comparison of Precipitation Departure in 2026/2025
(Rolling-3-Month, using [CHIRPS](#))**

Note: USDA-GADAS CHIRPS precipitation anomalies are reported on a rolling three-month basis. The 'January to March' period reflects cumulative conditions from January 1 to March 15, 2026, compared with the same calendar period in 2025, while the 'November to January' period reflects cumulative conditions from November 1 to January 31, 2026, compared with the same calendar period in 2025.

Source: [USDA-Foreign Agricultural Service Global Agricultural & Disaster Assessment System](#)

Consumption

Crush:

FAS Manila forecasts soybean crush in MY 2026/27 to remain flat. The Philippines has only one crushing facility for imported soybeans, which produces both soybean oil and soybean meal (SBM) for the company's own consumption. Industry contacts report that it is more economical to import SBM than invest in soybean crushing facilities, resulting in flat crush rates.

Food Use Consumption:

FAS Manila forecasts demand for soybeans for food use to increase by 4.0 percent to 52,000 MT in MY 2026/27 compared to the adjusted estimates in MY 2025/26. This growth is attributed to continued population expansion, rising household incomes that support greater spending on food and foodservice, and a sustained shift toward healthier eating patterns. Demand for soy drinks and soy sauce continues to expand year-on-year. In the Philippines, soybeans are processed into a range of food products for retail and foodservice use, including soymilk, soy sauce, soy oil, tofu, bean curd, and fermented soybean products (such as tausi —fermented black soybeans in brine — and localized miso used in fish stews).

Based on data from Euromonitor, the total sales volume of soy-based products — specifically soy drinks, soy sauce, and soy oil — rose modestly by an average of 0.3 percent per year between CY 2023 and CY 2025, and is expected to further increase by an average of 2 percent between CY 2025 to CY 2026. Consumer awareness of the health attributes of soy products continues to grow, particularly for soymilk, which grew by an average of 1.8 percent from CY 2023 to CY 2025 and is projected to further increase by 4.7 percent in CY 2026. Soy drinks target health-conscious and lactose-intolerant consumers. Soy sauce remains a staple condiment in the Philippines, widely used in home cooking and across the foodservice sector — including full-service restaurants, quick-service chains, and street food vendors — and grew by an average of 1.5 percent between CY 2023 and CY 2025, and is projected to grow further by 1.2 percent in CY 2026. In contrast, local soy oil demand decreased by an average of 2.4 percent per year from CY 2023 to CY 2025 and is expected to settle at 8,200 MT in CY 2026. Soy oil faces strong competition from other, more commonly used edible oils — such as coconut, palm, corn, canola, and olive oil — which are firmly established in both household and commercial kitchens. The steady, incremental growth in demand for soy drinks and soy sauce underpins higher soybean food-use demand in both MY 2025/26 and MY 2026/27.

Table 5: Soy Food Sales (1000 MT)						
Category	2023	2024	2025	2026(a)	Percentage Change	
					2023-2025	2026/2025
Soy Drinks	24.8	25.1	25.7	26.9	1.8	4.7
Soy Sauces	137.6	139.5	141.8	143.5	1.5	1.2
Soy Oil	8.6	8.4	8.2	8.2	-2.4	0.0
Average growth rate					0.3	2.0

Note: (a) – forecast from Euromonitor

Source of basic data: Euromonitor

Feed Waste Domestic Consumption:

Soybean use for feed is forecast to remain flat in MY 2026/27 compared to the revised estimate for MY 2025/26. Ongoing African swine fever (ASF) cases are expected to further limit soybean inclusion in feed rations in MY 2026/27. To contain production costs, feed millers typically replace whole soybeans with lower-cost imported SBM, soybean oil, and ready-to-mix full-fat soybeans (primarily used in feed for young animals, such as piglets). Commercial-scale feed millers also use formulation software and other technological tools to continuously adjust rations based on the most competitively priced feed ingredients available in the market.

Trade

FAS Manila forecasts soybean imports to rise by 2.4 percent to 128,000 MT in MY 2026/27 compared to the adjusted estimate in MY 2025/26. The forecast increase in soybean imports in MY 2026/27 is driven by rising demand for soybean-based food and beverage products, such as soy drinks, soy sauce, and tofu. The United States remains the leading soybean supplier, accounting for 84 percent of imports in MY 2024/25, followed by Canada with 15 percent and other suppliers with the remaining 1 percent. Post expects the United States to maintain its dominant market share in MY 2026/27, as industry contacts cite the high quality and competitive pricing of U.S. soybeans, which supports consistent quality standards in their food and feed production processes.

Source: Trade Data Monitor

Stocks

FAS Manila forecasts soybean ending stocks to marginally increase to 11,000 MT in MY 2026/27, up by 1,000 MT compared to the adjusted estimates for the previous marketing year, driven by higher food-use demand and stable feed use. The downward trend in import prices — particularly for U.S. soybeans, which account for the bulk of imports — also discourages traders and processors from carrying large

inventories, as they anticipate further price declines. Stocks are held primarily by food processors and feed millers.

Policy

No policy updates. Under [Executive Order \(EO\) No. 62, 2024](#), Soybean (1201) remains subject to 0 to 1 percent tariff rates. Soybean seed (HS Code 1201.10.00) is levied with 0 percent duties, while other soybean (HS Code 1201.90.00) is subject to 1 percent duties until 2028.

Soybean is included in the Philippine Department of Agriculture's (DA) National Corn Program, which supports local soybean production. The DA's National Corn Program is allocated with a [Php 6.7 Bn budget for Fiscal Year \(FY\) 2026](#), aiming to support the cultivation of various crops, including soybeans.

COCONUT: COPRA

Coconuts are processed into copra, which serves as the primary raw material for coconut oil mills to produce crude coconut oil (CNO) and its derivatives. These products are essential for both food and industrial applications, including cooking oils, soaps, cosmetics, and biofuels.

Table 6: Copra: Production, Supply, and Distribution

MY = Marketing Year, begins with the month listed at the top of each column						

Production

FAS Manila forecasts copra production to rebound to 2.65 million metric tons (MMT) in MY 2026/27, up by 1.9 percent compared to the adjusted estimates in MY 2025/26, supported by improved rainfall in 2025 and the recovery of trees from earlier heavy fruiting. Above-normal rainfall across many key coconut-growing regions — particularly Western Mindanao, Southern and Central Luzon, Bicol, Cagayan Valley, and Eastern Visayas — has helped coconut trees recover from stress and improve nut setting, supporting higher copra availability for crushing in MY 2026/27. Despite this improvement, production remains highly sensitive to weather conditions and is constrained by the predominance of smallholder, low-input production systems, which keep yields below those of other major coconut-producing countries.

The industry operates under the [Coconut Farmers and Industry Development Plan \(CFIDP\)](#) mandated by Republic Act 11524 (Coconut Farmers and Industry Trust Fund Act). The law provides for scheduled transfers from the Bureau of the Treasury totaling Php 75 billion over the first five years to the Coconut Farmers and Industry Trust Fund, in addition to existing coconut levy cash assets and related income already held by the government, and requires that the fund be maintained for 50 years, with at least Php 5 billion released annually to support coconut farmers and industry development programs. Under the CFIDP, the Philippine Coconut Authority (PCA) is implementing a Coconut Hybridization Program to boost yields by promoting hybrids derived from dwarf and tall varieties. Dwarf types typically begin bearing fruit in about three to four years, while tall varieties generally reach bearing age at around five to ten years; tall varieties, which can remain productive for up to 80-100 years, are preferred in typhoon-prone areas such as Cagayan Valley for their stronger root systems and greater resilience. Dwarf and hybrid plantings, with shorter bearing periods and productive lives of roughly 40-60 years, are being promoted in more favorable environments to accelerate yield gains.

The Philippine government has significantly expanded these efforts through a five-year planting and replanting program launched in 2023 that targets 100 million (Mn) new coconut trees by 2028. According to the Philippines Department of Agriculture (DA), more than 8.5 million trees were planted in 2024, with at least 15 million more targeted before the end of 2025, and Philippine President Ferdinand Marcos Jr. has [directed PCA to double its planting target for 2026 to 50 million trees](#), supported by a budget of over Php 7 billion. The DA notes that the massive replanting drive is critical because many of the country's [roughly 340 million standing trees are already aging or “senile”](#), resulting in sub-optimal output. International and domestic demand for coconut oil and fresh coconuts continues to increase, requiring increased coconut production.

According to industry contacts, under ideal conditions, a single coconut tree can produce on the order of one fruit bunch with about six nuts per month, which can be harvested at different stages depending on use — from *buko* (i.e., young or green coconut) (6-7 months) for coconut water and fresh preparations, to semi-mature nuts (8-9 months) for pies and confectionery, and fully mature nuts (10-12 months) for copra and oil milling. Industry contacts report that coconut use varies by region, with some areas marketing a relatively higher share of production as fresh *buko* rather than copra, reflecting strong local demand for coconut water; however, nationally, the bulk of coconuts still go into copra and oil processing. In regions where there are no local oil mills, coconuts are sold to traders who consolidate and transport nuts to milling regions, typically shouldering harvesting and transport costs and paying

farmers on a per-nut basis. Industry sources also note growing competition for mature nuts between oil mills and the need for seed nuts to support planting and replanting programs under the CFIDP.

In addition to replanting, PCA is implementing a fertilization program — supported by an estimated Php 1.8 billion budget for 2026 — that promotes the use of agricultural-grade salt to correct chlorine deficiency and improve yields on existing trees. According to DA and PCA officials, the goal is to raise average yields from [about 40](#) to [at least 60 nuts per tree annually](#) on treated stands while newly planted trees mature, which, if sustained, would support higher copra and coconut oil production in the medium term.

Table 7: Coconut and Copra Regional Production in the Philippines								
Regions	Coconut Mature (1000 MT)				Copra Equivalent (1000 MT) (a)			
	MY 2023/2024	MY 2024/2025	Q4 2024	Q4 2025	MY 2023/2024	MY 2024/2025	Q4 2024	Q4 2025

Source: FAS Manila estimate, using production data from the [Philippine Statistics Authority](#), and conversion ratio from the United Coconut Association of the Philippines

Area Harvested

FAS Manila forecasts coconut area harvested increase by 1.4 percent to 3.65 Mn ha in MY 2026/27 compared to the previous marketing year, with gradual gains as CFIDP- and Marcos-administration-supported planting and replanting programs scale up and more newly planted trees enter bearing age. In the near term, changes in output are driven more by weather and tree productivity than by large shifts in area, as most existing coconut land remains in production and large-scale conversion out of coconuts is limited by the crop's importance to rural livelihoods.

Under the CFIDP, PCA's coconut planting and replanting programs use both expansion areas and existing coconut lands. Expansion areas include land currently planted to other crops (such as corn and banana) or used for livestock, while the replanting program targets non-productive or senescent trees. As a rule, old trees are cut only once replacement trees approach first harvest, which helps avoid abrupt reductions in area harvested. The administration's five-year planting initiative—aiming for 100 million new trees by 2028 and a 50-million-tree target in 2026—will initially increase the stock of non-bearing trees, with a more noticeable impact on effective bearing area beginning three to four years after planting for dwarf and hybrid material, and roughly five to ten years for tall varieties.

The Coconut Hybridization Program, combined with PCA’s fertilization initiative using agricultural-grade salt from Pangasinan to correct chlorine deficiency and trunk-injection treatments for trees affected by pests, is expected to support higher productivity over time. Given that dwarf and hybrid plantings typically bear fruit within three to four years and tall varieties within about five to ten years, these interventions are expected to contribute more visibly to increased effective area harvested and higher production beyond MY 2026/27. In the short to medium term, however, FAS Manila expects the reported area harvested to remain flat, with productivity-driven gains — rather than large net changes in planted or harvested area — providing the main source of production growth.

Consumption

Crush:

FAS Manila forecasts copra crush to increase to 2.7 MMT in MY 2026/27, up by 1.9 percent compared to the previous marketing year, broadly tracking increase in copra availability rather than any expansion in installed milling capacity. Based on the United Coconut Association of the Philippines’ Coconut (UCAP) Industry Kit from August 2025, as of July 2024, the Philippines still has 61 coconut oil mills with a combined annual rated capacity of about 4.14 MMT (same annual rated capacity in 2023), up by 12.3 percent from almost 3.69 MMT earlier in 2022, but no additional capacity increases are expected during the forecast period. Instead, higher crush volumes reflect improved utilization of existing plants as weather conditions normalize and coconut output gradually recovers. Based on the same UCAP report, the estimated capacity utilization of oil mills increased from 69.5 percent in 2022 to 78.7 percent in 2024.

Industry contacts report that millers adjust crush rates in response to both raw material supply and demand for coconut oil in food, industrial, and biodiesel applications. The current B3 biodiesel mandate continues to underpin steady demand for coconut methyl ester (CME), encouraging mills to maintain relatively high operating rates when copra is available. At the same time, firm international demand for coconut oil and expected medium-term gains from CFIDP-supported planting, replanting, and fertilization programs support millers’ expectations of sustained copra inflows. Given these factors, FAS Manila expects crushing volume to remain closely aligned with domestic copra production and modest imports of about 50,000 MT per year, with no significant changes in capacity utilization beyond the incremental improvements already captured in recent years.

Table 8: Copra Crushing Capacities of Coconut Oils Mills in the Philippines (as of July 2024)		
Region	No. of Plants	Capacity (MT/year)
Bicol	3	223,500
Calabarzon	20	825,100
Caraga	1	22,500

Trade

FAS Manila forecasts copra imports to remain at around 50,000 MT in MY 2026/27, as domestic production modestly recovers but still faces structural constraints from aging trees and low-input smallholder systems. Imports will continue to serve as a supplemental source of raw material that helps mills maintain stable crushing operations during periods of localized supply tightness or weather-related disruptions, rather than as a primary driver of supply. Industry contacts report that, with the biodiesel blend rate assumed to remain at B3 and no major changes in coconut oil export demand, mills see limited incentive to expand imports beyond current levels.

Stocks

FAS Manila forecasts copra stocks to remain marginal at about 1,000 MT in MY 2026/27, as stronger crushing demand absorbs the modest increase in available supply. Traders and oil mills typically minimize copra inventories because the product is bulky, prone to quality deterioration, and requires careful handling and storage in the country's humid climate. With imports broadly stable at around 50,000 MT and little change in crushing capacity, mills and traders are expected to continue operating with just enough working stocks to keep plants running efficiently, while avoiding the costs and risks associated with holding larger inventories.

Policy

No policy updates. Under [EO No. 62, 2024](#), copra (HS Code 1203) is levied with 10 percent tariff rate until 2028.

MEALS SECTION

SOYBEAN MEAL

Soybean meal (SBM) is primarily used as an ingredient for animal and aquaculture feed. It is a major crude protein in animal feed formulation.

Table 10: Soybean Meal: Production, Supply and Distribution

Production

FAS Manila forecasts SBM production to remain flat in MY 2026/27. There is only one crushing facility in the country that produces SBM for the company's own livestock and poultry operations.

Consumption

Feed Waste Domestic Consumption

FAS Manila forecasts SBM feed use to increase by 0.9 percent to 3.28 MMT in MY 2026/27 compared to the adjusted estimates for the previous marketing year, reflecting higher overall demand for commercial and self-mixed feeds. Growth in poultry and aquaculture production, together with continued expansion in the pet food and dairy sectors, supports increased SBM inclusion in feed rations. Industry contacts report that broiler, layer, and aquaculture feeds maintain relatively high SBM shares in their formulations, consistent with the protein requirements of these sectors.

Poultry and aquaculture are the main drivers of SBM demand growth, and rising production in these industries partially offsets the moderated SBM demand from the swine industry. Industry contacts report that broiler, layer, and aquaculture feed typically contain the highest SBM inclusion rates among major feed types, so higher output in these industries directly translates into increased SBM offtake.

Ongoing ASF cases continue to limit feed demand from the hog industry relative to pre-ASF levels, which tempers SBM growth in swine rations, but feed use for broiler, layer, and aquaculture, along with the pet food industry, partially offsets this constraint.

Corn, feed wheat, DDGS, and other by-products provide complementary energy and protein sources; however, feed millers continue to anchor their formulations on SBM to meet crude protein and amino acid specifications. As a result, SBM remains the primary protein meal in compound feeds in MY 2026/27.

Table 13: Philippine Imports of Major Feed Ingredients (MT)

Source: FAS Manila estimates and interview

Trade

FAS Manila forecasts SBM imports to increase slightly by 0.2 percent to more than 3.25 MMT in MY 2026/27, in line with higher total feed demand from the poultry, aquaculture, and pet food sectors. Growth in broiler and layer production, together with increased aquaculture output, sustains demand for high-protein feed ingredients. SBM remains the primary crude protein source in commercial rations, with inclusion rates that reflect its role as the standard against which other protein meals are balanced. Ongoing ASF cases continue to limit hog feed demand relative to pre-ASF years, but feed use for poultry and aquaculture maintains overall SBM consumption growth in MY 2026/27.

Feed millers continue to adjust formulations among corn, feed wheat, DDGS, and other by-products based on relative prices, while keeping SBM at the core of their protein mix to meet nutritional specifications. Imported SBM and soybean residues supply virtually all domestic requirements, as output from the country's lone soybean crusher is used internally within the same integrated operation. Major suppliers remain global exporters with established trade relationships with Philippine feed millers.

Figure 3: Key Import Sources of SBM in the Philippines

Source of basic data: Trade Data Monitor

Figure 4: Unit Value of SBM in the Philippines

Note: Based on Philippine import prices for soybean oilcake and other residues (HS Code 2304) from the United States. HS Code 2304 accounts for more than 99 percent of the total Philippine imports of SBM.

Source of basic data: Trade Data Monitor

Stocks

FAS Manila forecasts SBM ending stocks at 254,000 MT in MY 2026/27, lower by 3,000 MT compared to the revised estimate for MY 2025/26, as higher feed use draws down inventories despite a modest increase in imports. Stocks remain limited relative to annual consumption and function primarily as working inventories to support uninterrupted feed manufacturing.

SBM stocks are held mainly by commercial feed millers, livestock and poultry integrators, and traders. These firms adjust stock levels to align with shipment schedules and expected feed demand from their contract growers and customers, while accounting for storage conditions in the country's hot and humid climate.

Policy

No policy updates. Under [EO No. 62, 2024](#), soybean oilcake and other residues (HS Code 2304) is subject to a 0 percent tariff until 2028, while bran, sharps, and other residues (HS Code 2302.50), and flours and meals of soybean (HS Code 1208.10) are subject to a 3 percent tariff rate until 2028.

COPRA MEAL

Copra meal is a by-product generated when copra is crushed to produce coconut oil. It is used as an ingredient in animal feed formulations.

Table 15: Copra Meal: Production, Supply and Distribution						
Copra Meal	2024/2025		2025/2026		2026/2027

(1000 HA), (1000 MT)						
MY = Marketing Year, begins with the month listed at the top of each column						

Production

FAS Manila forecasts copra meal production to marginally increase by 0.6 percent to 870,000 MT in MY 2026/2027 compared to previous marketing year, given a slight rebound in the coconut supply available for crushing. Copra meal, or copra cake, is a by-product derived during the extraction of coconut oil. Copra meal is used by commercial feed mills in their animal feed production.

Feed Consumption

FAS Manila forecasts copra meal use in feed to further decline by 0.9 percent to 525,000 MT in MY 2026/27, following the decrease in MY 2025/26 compared to MY 2024/25, due to continuously increasing copra meal prices. Industry contacts explain that copra meal cannot fully substitute for SBM in feed formulations because copra meal has higher crude fiber and lower energy and protein digestibility for monogastric animals such as swine and poultry, so feed millers often need to add enzymes to improve its nutritional value. The rising price of copra meal is also expected to limit its inclusion in feed rations in MY 2026/27. Industry contacts add that SBM contains roughly twice as much crude protein as copra meal, allowing feed millers to achieve the desired nutritional profile of animal feed more efficiently with SBM.

Given the sharp decline in copra meal prices through MY 2023/24, prices started to recover in MY 2024/25, rising to double-digit levels from Php 11.15 per kilogram (kg) in May 2025 (a 31.6 percent increase compared to the same period last year) to as much as Php 17.27 per kg in December 2025 (a 29.5 percent increase compared to the same period last year and the highest price since MY 2023/24). This price rebound is expected to further encourage feed millers to favor SBM over copra meal in their rations as the cost advantage of copra meal narrows.

Trade

FAS Manila forecasts copra meal exports to increase by 1.2 percent to 344,000 MT in MY 2026/27 compared to the previous marketing year, driven by higher copra crushing and the diversion of product away from the domestic feed market as rising domestic prices limit its use as an animal feed ingredient in local animal feed. South Korea remains the top destination for copra meal.

Source: United Coconut Association of the Philippines

Stocks

FAS Manila forecasts ending stocks to marginally increase by 2.4 percent to 42,000 MT in MY 2026/2027 compared to the adjusted estimates in MY 2025/26, given the slight rebound in domestic production amidst strong export demand. Locally, copra meal stocks are held by private traders, oil millers, and feed millers.

Policy

No policy updates. Under [EO No. 62, 2024](#), copra meal (HS Code 2306.50) is subject to 10 percent tariff rate until 2028.

OILS SECTION

SOYBEAN OIL

Soybean oil is a by-product of the processing of soybeans. The primary product obtained from soybeans is SBM, which is used as a raw ingredient for animal feeds. The oil is extracted from soybeans during this process and is used in various food products and industrial applications.

Table 16: Soybean Oil: Production, Supply and Distribution						
Soybean Oil	2024/2025		2025/2026		2026/2027	
Market Year Begins	Jan 2025		Jan 2026		Jan 2027

Ending Stocks (1000 MT)	7	7	10	10	0	13
Total Distribution (1000 MT)	71	69	81	72	0	74
(1000 HA), (1000 MT)						
MY = Marketing Year, begins with the month listed at the top of each column						

Production

FAS Manila forecasts soybean oil production to remain flat in MY 2026/2027 due to limited domestic crushing capacity. The country has only one soybean crushing facility, and its output is primarily used for feed inclusion within the company's own operations. Industry contacts report that it is more economical to import SBM than invest in soybean crushing facilities, which in turn constrains soybean oil output and keeps crush rates flat.

Food Consumption

FAS Manila forecasts soybean oil consumption to decline marginally to 57,000 MT in MY 2026/27, down by 1,000 MT compared to the estimate for MY 2025/26, due to competition from other cooking oils, alongside decreased domestic production of soybeans. Nonetheless, demand remains supported by its continued use for culinary purposes and as an ingredient in manufactured food products such as snack

foods, biscuits, and confectionery. Industry sources in the food industry report that coconut oil is preferred for its neutral taste and palm oil for its cost-competitive pricing, while soybean oil occupies a smaller niche as a specialized oil for food formulations.

Industrial Consumption

Although FAS Manila forecasts industrial consumption to remain flat at 4,000 MT for MY 2026/27, there is no official data reported on industrial consumption of soybean oil in the country. The Philippines is a traditional producer of coconut oil and uses coconut oil and palm oil more extensively than soybean oil for both culinary and industrial applications, which limits the development and reporting of industrial soybean oil use.

Trade

FAS Manila forecasts soybean oil imports to decline marginally to 59,000 MT in MY 2026/27, down by 1,000 MT compared to the estimate for MY 2025/26, due to increased use of palm oil blended with coconut oil in the food industry. The availability of coconut oil and palm oil in the market allows these oils to maintain market dominance, making them the traditional oils in the Philippine market for both cooking and industrial applications. Filipino consumers are more inclined to purchase coconut oil due to positive health perceptions for coconut oil, while choosing palm oil as a substitute whenever there is a price surge in coconut oil.

Source: Trade Data Monitor

Stocks

FAS Manila forecasts ending stocks to increase to 13,000 MT in MY 2026/2027, up by 30 percent compared to 10,000 MT in the previous marketing year. Although imports are forecast to marginally

decline from 60,000 MT in MY 2025/26 to 59,000 MT in MY 2026/27 and production is expected to remain flat at 5,000 MT in both years, total domestic consumption — particularly food use — falls from 62,000 MT in MY 2025/26 to 61,000 MT in MY 2026/27, allowing a larger share of available supply to carry over as ending stocks. The bulk of these stocks is held by processors and large retail outlets, as soybean oil remains a lower-priced alternative to coconut oil but does not fully displace traditional oils such as coconut oil and palm oil in retail and foodservice channels.

Policy

No policy updates. Under [EO No. 62, 2024](#), Soybean Oil (HS Code 1507) is levied a 7 percent tariff rate until 2028.

COCONUT OIL

Coconut oil is produced as a by-product of coconut processing, with coconuts being abundant in the Philippines. The primary product is copra, the dried meat or kernel of the coconut, which is crushed to extract crude coconut oil (CNO) and refined, bleached, and deodorized (RBD) coconut oil.

MY = Marketing Year, begins with the month listed at the top of each column						

Production

The Philippines is one of the world's largest producers and exporters of coconut oil. This oil is widely used in cooking, cosmetics, and industrial applications. FAS Manila forecasts coconut oil production to marginally increase by 3.5 percent to 1.76 MMT in MY 2026/27 compared to the previous marketing year, given a forecast increase in copra crushing.

Food Consumption

FAS Manila forecasts food use consumption to increase by 4.8 percent to 220,000 MT in MY 2026/27 compared to the previous marketing year. There remains strong demand from the food industry for coconut oil because of its neutral taste and perceived health benefits compared to palm oil. Industry contacts report that more food technologists are formulating blended coconut oil–palm oil products to manage rising coconut oil costs. However, overall coconut oil demand continues to increase, supported by sustained growth in the foodservice sector.

On the consumer side, households can easily shift between coconut oil and palm oil for cooking, the traditional oils in the Philippine market for cooking applications. Retail consumers generally perceive coconut oil as a healthier alternative to palm oil, which helps sustain its demand even as prices rise.

Notes: (a) – computed by averaging the lower- and upper-bound daily retail prices of coconut oil and palm oil, as of March 16, 2026

Source of basic data: [Philippine Department of Agriculture](#)

Industrial Consumption

FAS Manila forecasts coconut oil consumption for industrial uses to increase by 1.2 percent to 420,000 MT in MY 2026/27 compared to the previous marketing year, supported by increased demand for

manufacturing personal care products such as soaps and cosmetic products, and continued inclusion in biodiesel blend.

As of March 2026, the Philippines continues to implement a 3 percent (B3) biodiesel blend in diesel fuel, after deferring previously planned increases to 4 percent (B4) and 5 percent (B5). The government is considering legislation that would temporarily suspend the mandatory use of locally sourced biofuels for one year to allow imports of lower-cost biofuels in response to rising oil prices.

The Philippine Coconut Authority (PCA) has [publicly opposed any full suspension of the biodiesel mandate](#), arguing that the program is the main driver of domestic demand for coconut oil and that displacing coconut methyl ester (CME) with imported palm methyl ester (PME) would push surplus supply into lower-priced export markets, depress copra prices, and negatively affect millions of coconut farmers. The PCA also warns that a sharp policy reversal could jeopardize 14 domestic CME production facilities and associated employment, and maintains that a calibrated adjustment — such as a temporary reduction of the blend rate rather than a complete halt — would better protect both farmer livelihoods and the environmental advantages of coconut-based biofuels. Given ongoing developments in this policy, Post assumed industrial demand for biodiesel blending at B3.

Source: United Coconut Association of the Philippines

Trade

FAS Manila forecasts coconut oil exports to increase by 5.3 percent to 1.19 MMT in MY 2026/27 compared to the previous marketing year, in line with higher coconut oil production from increased copra crush and improved extraction. Despite this increase, export volumes remain below MY 2024/25 levels, as a larger share of output continues to supply domestic industrial and food use, including

biodiesel blending under the B3 mandate. Industry contacts report that exporters are maintaining their focus on key traditional markets while monitoring evolving quality and sustainability requirements in major destinations.

FAS Manila forecasts imports to remain flat at 90,000 MT for MY 2026/27, compared to the previous marketing year.

Stocks

FAS Manila forecasts coconut oil ending stocks to remain stable in MY 2026/27 at 72,000 MT compared to the adjusted estimates in the previous marketing year. This reflects a modest increase in total supply during MY 2026/27, reflecting rising exports and higher industrial and food use, leaving carryout stocks broadly flat. Stocks are primarily held by private companies, such as oil millers, refiners, exporters, and biodiesel producers, to ensure a readily available supply for export commitments and domestic industrial and food sector needs.

Policy

No policy updates. Under [EO No. 62, 2024](#), coconut oil (HS Code 1513.11 and 1513.19) are levied with 10 percent tariff rate until 2028.

PALM OIL

Palm oil is one of the most used edible oils in the Philippines and is a key vegetable oil in international trade. It is produced from the fresh fruit bunches (FFB) of the oil palm, which yield about 18–25 percent crude palm oil (CPO) and 4 percent palm kernel during processing. Palm oil serves as an ingredient in a wide range of food items, cosmetic products, and other industrial uses.

Production

FAS Manila forecasts palm oil production to rise by 4.2 percent to 125,000 MT in MY 2026/2027 compared to the adjusted estimates in MY 2025/26, due to a forecast increase in FFB supply for pressing. Production of FFB increased by 6.4 percent year-on-year from 540,644 MT in CY 2023 to 607,212 MT in 2025, based on data from the Philippine Statistics Authority. Government plans to expand budgetary support for palm oil — including a [proposed increase in funding for the sector to Php 1.2 billion by 2027](#) — and to develop oil palm nurseries and locally cultivated planting materials in Mindanao, together with private investment such as the [Php 600-million Soccsksargen refinery](#), are expected to encourage further area expansion and productivity gains in MY 2026/27.

The bulk of the oil palm plantations are located in Mindanao area, with Soccsksargen (34 percent) and Caraga (30 percent) regions being the largest producers. Other plantations in Mindanao include Zamboanga Peninsula, Bangsamoro Autonomous Region in Muslim Mindanao (BARMM), Northern Mindanao, and Davao regions. There are also plantations in Luzon and Visayas, specifically in Mimaropa and Central Visayas regions.

Table 20: Oil Palm Production and Area Harvested					
Year	FFB Production (MT)	Estimated Palm Oil Extracted (a) (MT)	Area Harvested (ha)	Percentage Change, FFB Production	Percentage Change, Area Harvested
2023	540,644	116,238	63,544		
2024	521,801	112,187	68,315	-3.5	7.5
2025	607,212	130,551	64,575	16.4	-5.5
			Average	6.4	1.0

Note: (a) – FAS Manila estimates FFB extraction rate at 22 percent, or the average between the 18 to 25 percent palm oil content of FFB, as noted at Philippine Coconut Authority’s Philippine Palm Oil Industry Roadmap 2024-2033

Sources of basic data: [Philippine Statistics Authority](#), and [Philippine Coconut Authority](#)

Based on the Philippine Coconut Authority’s [Philippine Palm Oil Industry Roadmap 2024-2033](#), oil palm plantations generally remain profitable for 25 years, after which the trees need to be replanted. As of February 26, 2026, and as reported by the roadmap as well, there are [11 palm oil mills](#) with a rated capacity of 275 MT FFB/hour.

Food Consumption

FAS Manila forecasts consumption to increase by 0.4 percent to 1.285 MMT in MY 2026/2027, given an increase in demand from the Filipino households, and the consumer food and the food processing industries.

Palm oil is widely used as a cooking oil in Filipino households and in the food service industry because it is priced lower than many other vegetable oils and offers good durability and resistance to high temperatures. It is a direct substitute for coconut oil in food applications, so higher retail prices of coconut oil are expected to shift demand among price-sensitive consumers and food establishments toward palm oil. However, many Filipino consumers still prefer coconut oil over palm oil due to perceived health benefits, as long as coconut oil remains relatively affordable. Industry sources note that, in response to rising coconut oil prices, food technologists in the food industry are increasingly using coconut-palm oil blends at levels that do not noticeably alter the taste profile of fried products.

Industrial Consumption

FAS Manila forecasts a 1.4 percent increase in industrial consumption to 218,000 MT in MY 2026/27 for the manufacture of various consumer products, such as soap, cosmetics, and pharmaceuticals. The increase in population is expected to drive the demand for these products.

Trade

FAS Manila forecasts palm oil imports to increase by 0.3 percent to 1.465 MMT in MY 2026/2027, given the forecast increase in both food and industrial consumption. Post, meanwhile, forecasts palm oil exports to remain flat percent during the same period due to higher local demand.

The Philippines is a net importer of refined palm oil, and a net exporter of crude palm oil. Refined palm oil (HS Code 1511.90) account for almost the entire Philippine palm oil imports. Crude palm oil (HS Code 1511.10), meanwhile, account for more than 99 percent of the Philippine palm oil exports.

Table 21: Key Exporters of Palm Oil to the Philippines (MT)			
Exporter	CY 2023	CY 2024	CY 2025
Indonesia	462,146	419,851	708,747
Malaysia	430,005	663,338	697,480
All Others	223	230	211
Total	892,374	1,083,419	1,406,438

Stocks

FAS Manila forecasts palm oil stocks to rise by 15.7 percent to 162,000 MT in MY 2026/27, as private companies build inventories to meet growing food and industrial demand, including processed foods, soap, cosmetics, and pharmaceuticals. While Post also expects higher coconut oil production, continued export demand are projected to divert coconut oil away from food and industrial users, prompting greater reliance on palm oil as a substitute. Palm oil stocks are held by private firms, such as oil millers, refiners, and traders, to ensure a steady supply to these sectors.

Policy

No policy updates. The Philippine Coconut Authority is tasked with the development of the Philippine palm oil industry. Under [EO No. 62, 2024](#), palm oil (HS Code 1511) is subject to 15 percent tariff until 2028.
