

Required Report: Required - Public Distribution

Date: April 08, 2026

Report Number: UP2026-0011

Report Name: Oilseeds and Products Annual

Country: Ukraine

Post: Kyiv

Report Category: Oilseeds and Products

Prepared By: Denys Sobolev

Approved By: Megan Francic

Report Highlights:

Post forecasts Ukrainian farmers will maintain similar total marketing year (MY) 2026/27 areas under oilseed production as in MY2025/26. Post forecasts higher sunflower and rapeseed areas at the expense of soybeans. Weather has been favorable at the beginning of spring 2026. A combination of an export duty on soybeans and rapeseed, excess crush capacity, and a lack of sunflower seeds led to increased rapeseed and soybean crush for MY2025/26. Post expects this trend to stretch into MY2026/27. The EU will remain the primary market for Ukrainian oilseeds and oils, but is slowly importing a smaller percentage of meals. Domestic food demand for vegetable oils, predominantly sunflower, is falling due to the continued outflow of Ukrainian refugees.

Abbreviations:

MEEA – Ministry of Economics, Environment, and Agriculture of Ukraine

CY – Calendar Year

ha - Hectare

MY – Marketing Year

MT – Metric Ton

MMT – Million Metric Tons

NDVI – Normalized Difference Vegetation Index

PSD – Production, Supply, and Distribution

SSSU – State Statistics Service of Ukraine

Data included in this report is not official USDA data. Official USDA data is available at <https://apps.fas.usda.gov/psdonline/app/index.html#/app/home>

For the purpose of this report, the beginning month of a marketing year (MY) for a specific commodity is referenced in the relevant PSD table.

Disclaimer: *Due to the Russia-Ukraine war, there have been delays in publishing State Statistics Service of Ukraine (SSSU) information on the status of Ukrainian agriculture in Ukrainian government-controlled areas. Ministry of Economy, Environment, and Agriculture (MEEA) data was used instead, as referenced. In this report, FAS/Kyiv cannot provide any production estimates for Russia-occupied territories, except for the Crimean Peninsula, due to the need for more credible and verifiable information. Because of the rapidly changing situation, this report provides a snapshot of the situation accompanied by assumptions and estimates that were valid at the time of report writing.*

General Outlook

The full-scale Russian invasion in February 2022 caused havoc for farmers and exporters of bulk agricultural commodities, including oilseeds. The most significant issue was a breakdown in commodity logistics from seaports from March to July 2022, resulting in the subsequent accumulation of large stocks and spillover of Ukrainian commodities into neighboring EU countries. Some EU member states introduced unilateral trade limitations, predominantly for oilseeds, that are still in place. At the time of report writing, Bulgaria, Romania, Slovakia, Hungary, and Poland continue to unilaterally ban imports of Ukrainian oilseeds. While the EU also adopted import quotas for agricultural products from Ukraine, oilseeds were not affected (see GAIN Report [UP2025-0034](#) for more information).

The Ukrainian Parliament introduced a 10 percent export duty on rapeseed and soybeans from Ukraine (see GAIN Report [UP2025-0026](#)). Combined with a low marketing year (MY) 2025/26 sunflower crop, the duty supported in-country crush for soybeans and rapeseed.

The increase in crude oil and nitrogen fertilizer prices in early March 2026 might prompt some farmers to switch from grains to oilseeds in MY2026/27.

Oilseeds

Sunflower

Soybeans

Rapeseed

Production

Historically, oilseed production has offered better profitability compared to grains. Contacts indicated, if the growth in global fuel and fertilizer prices continues well into calendar year (CY) 2026, some farmers might switch from grains to oilseeds. Industry also noted medium and large farmers have already purchased the necessary inputs for spring planting and have prepared their fields for a specific crop. This will limit any significant deviations in perspective plantings for MY2026/27. However, contacts note small farmers are more likely to make their planting decisions later; therefore, Post will make any necessary oilseed adjustments based on CY2026 MEEA planting data.

Post estimates MY2026/27 total oilseed area at 8.6 million hectares (ha), which is equivalent to the five-year average. According to SSSU official data, 1.3 million ha of winter rapeseed has already been planted. This area is 11 percent higher than in MY2025/26. Post accepts this number as the initial estimate for MY2026/27 rapeseed area, as spring rapeseed areas are minimal. The remainder of the total estimated oilseed area will be split between two spring crops: sunflower and soybeans.

Imports of sunflower seeds are higher ahead of MY2026/27 planting season compared to the previous MY (Figure 1). Some of these volumes might have been imported for domestic processing to compensate for a shortage of domestic sunflower seeds in MY2025/26; however, there is an increase in imports from destinations that historically supply sunflower seeds for planting. Post uses this as a valid argument to increase its MY2026/27 sunflower area estimate to 5.4 million ha, a 6 percent increase compared to Post's previous MY estimate.

Figure 1: Sunflower Seed Imports to Ukraine, MT

Source: Trade Data Monitor, LLC (TDM)

Based on the total estimated oilseed area, Post forecasts MY2026/27 soybean area at 1.8 million ha, an 11 percent decrease against Post's previous MY estimate.

At the time of report writing, the normalized difference vegetation index (NDVI) was close to the long-term average (Figure 2). This indicates there are no significant issues for winter crops, specifically winter rapeseed. Note that NDVI is a standardized measure of vegetation. High values indicate healthier vegetation, while low values indicate low or no vegetation.

Figure 2: NDVI for Ukraine

Mid-March 2026, the beginning of planting season, featured sufficient amounts of both surface and sub-surface moisture (Figures 3 and 4). This indicates plants will have good conditions immediately after planting and a sufficient amount of moisture after germination.

Figure 3: SMAP Surface Soil Moisture, 0-5 cm

Source: GADAS

Figure 4: SMAP Root Zone Soil Moisture, 0-100 cm

Source: GADAS

Based on moisture availability, FAS/Kyiv estimates MY2026/27 oilseed yields higher than the five-year average and roughly on par with MY2023/24 levels (Figure 5).

Figure 5: Oilseed Yields, MT/ha

Source: USDA Official

Post's MY2026/27 production estimate is:

- Sunflower – 12.8 million metric tons (MMT), a 16 percent increase against Post's MY2025/26 estimate
- Soybeans – 4.7 MMT, a 5 percent decrease
- Rapeseed – 4.0 MMT, a 25 percent increase

Post updated its MY2025/26 production estimates on SSSU data:

- Sunflower – 11.0 MMT, a 15 percent decrease against Post's MY2024/25 estimate
- Soybeans – 4.9 MMT, a 31 percent decrease
- Rapeseed – 3.2 MMT, a 15 percent decrease

Note Post's MY2025/26 sunflower estimate is not in line with SSSU's official number of 10.2 MMT. SSSU generally underreports sunflower production volumes.

Trade

Ukraine is a net exporter of bulk agricultural commodities, including all major grains and oilseeds. It is critically dependent on access to ports and marine routes to ensure cost-efficient logistics for large

volumes of oilseeds, oils, and meals. The majority of export bandwidth is dedicated to grains (Figure 6). Oilseed exports fluctuate in line with available export capacity, including rail, truck, and port. All major Ukrainian sea ports (Odesa, Chornomorsk, and Pivdennyi) and Danube River ports are functioning normally.

Figure 6: Exports of Selected Commodities from Ukraine, MMT

Source: MEEA

* Wheat, Barley, Corn, Soy, Rapeseed, Sunflower, Soy Oil, Sunflower Oil, Vegetable Meals

The EU has been an important destination for Ukraine for a number of agricultural products following the temporary suspension of import duties and quotas on Ukrainian agricultural exports, initially set by [Regulation 2022/870](#) of the European Parliament and the Council in July 2022. The EU's introduction of updated import quotas for agricultural products from Ukraine in October 2025 retained an opening for Ukrainian oilseeds to the European market. See GAIN Report [UP2025-0034](#) for more information.

Ukraine maintains export licenses for rapeseed and sunflower seed to Bulgaria, Romania, Slovakia, Hungary, and Poland as these individual countries imposed unilateral import limitations. For more details, see Annex 4 of Resolution #1795 ([in Ukrainian](#)).

MEEA and industry contacts expect the [EU Deforestation Regulation](#) (EUDR) will become an important market access factor for Ukrainian soybeans, meal, and oil entering the EU market. For the purpose of this report, Post assumes Ukraine will ensure EUDR compliance by the current implementation date of December 30, 2026.

Ukraine exports over 80 percent of all rapeseed and sunflower seeds to the EU (Figure 7).

Figure 7: Share of Oilseeds Exports from Ukraine to the EU

Source: TDM

At the beginning of MY2025/26 (July 2025-February 2026), total rapeseed exports were 1.6 MMT, 47 percent below the same period in the previous MY. Rapeseed exports slumped due to lower production volumes combined with growth in domestic crush.

Sunflower exports were 21,000 MT from September 2025-February 2026, as the vast majority of sunflower seeds are crushed in-country.

Soybeans are the only Ukrainian oilseed with a substantial market outside of the EU. At the beginning of MY2025/26 (September 2025-February 2026), Ukraine's largest export markets were the EU (635,000 MT) and Türkiye (615,000 MT).

Based on production and domestic crush forecasts, FAS/Kyiv's MY2026/27 export forecast is:

- Sunflower seeds – 30,000 MT, a 14 percent decrease against Post's MY2025/26 estimate
- Soybeans – 1.7 MMT, a 15 percent decrease
- Rapeseed – 2.0 MMT, a 5 percent decrease

Post forecasts low ending stocks for all oilseeds for both MY2026/27 and MY2025/26 due to a combination of increased domestic crush and functioning export logistics.

Post's MY2025/26 production estimate for soybeans is 10 percent lower than the USDA official number on available SSSU numbers.

Post's MY2025/26, export estimate for soybeans is 13 percent lower than the USDA official number on increased crush.

Post's MY2025/26 soybean crush estimate is 7 percent higher than the USDA official number based on increased crush due to the lack of sunflower.

Post's MY2025/26 production estimate for rapeseed is 8 percent lower than the USDA official number on available SSSU numbers.

Post's MY2025/26 export estimate for rapeseed is 14 percent lower than the USDA official number on increased crush and lower production.

Post's MY2025/26 crush estimate for rapeseed is 5 percent higher than the USDA official number based on increased crush due to lack of sunflower.

Oils

Sunflower Oil

Soybean Oil

Rapeseed Oil

Palm Oil

Production

The SSSU collects data but has postponed its publication due to martial law. Therefore, in the absence of reliable statistics for domestic production of certain commodities, Post assumes monthly export volumes for soybean and rapeseed oils are equivalent to the total oil output of domestic crush facilities.

According to industry, the dynamics of sunflower oil production also very closely correlate with its exports, with domestic consumption below 10 percent of total production volume. Post uses its estimates for exportable vegetable oil volumes to reverse-engineer an oilseed crush volume, which then is used to calculate a meal output.

There has been no recent statistical information about crush capacity, though industry estimates it at around 20 MMT per year. This includes a wide variety of processing facilities, ranging from modern industrial facilities capable of processing a variety of oilseeds via chemical extraction to small cold-press facilities located in rural areas. The lack of oilseeds for crush in MY25/26 favored two different types of facilities: very large and very small. Large, strategically placed facilities could offer economies of scale due to their efficiency and ability to process different oilseeds to prolong their operations, while small-scale local facilities were able to offer lower logistical costs by compressing kernels/beans into crude vegetable oil and oil cake intended for further processing.

The combination of excess crush capacity, as one-third of existing capacity was idle according to industry estimates, and a drop in sunflower production volume, the principal raw crush material, for MY2025/26 sparked competition between crushers and exporters over available soybean and rapeseed stocks. In early September 2025, Ukraine introduced a 10 percent export duty for rapeseed and soybeans. These dynamics increased crush-to-production ratios for rapeseed and soybeans in Ukraine for MY2025/26.

Prices for sunflower seeds continued to climb, while production fell on weather (Figure 8). In addition, significant rapeseed volumes were exported due to an earlier start to the MY. This provoked a price rally among crushers for both soybeans and sunflower seeds to keep their facilities operational.

Figure 8: Domestic Oilseed Prices in Ukraine, UAH/MT (EXW)

Source: APK-Inform

Post increased MY2025/26 crush-to-production ratio estimates for soybeans and rapeseed on the abovementioned developments (Figure 9). Post also forecasts further crush-to-production ratio growth for rapeseed in MY2026/27 due to the export duties.

Figure 9: Estimated Crush-to-Production Ratio for Selected Oilseeds

Source: FAS/Kyiv

FAS/Kyiv's MY2026/27 production forecast is:

- Sunflower oil – 5.5 MMT, a 15 percent increase against Post's MY2025/26 estimate on higher forecasted production
- Soybean oil – 551,000 MT, a 3 percent decrease, on lower production
- Rapeseed oil – 820,000 MT, a 25 percent increase

Trade

Growing soybean and rapeseed oil exports indicate Ukrainian processors were actively substituting these due to the lack of sunflower seeds at the beginning MY2025/26 (September 2025- February 2026) (Figure 10).

Figure 10: Rapeseed and Soybean Oil Exports from Ukraine

Source: TDM

Based on its MY2025/26 sunflower oil production estimate, Post estimates Ukraine will export approximately 4.5 MMT of sunflower oil, a 5 percent decrease against the previous MY. From September 2025-February 2026, over half of Ukraine's exports went to the EU and India, following a similar pattern in MY2024/25 (Figure 11).

Post's MY2025/26 soybean oil export estimate is 570,000 MT, a 9 percent increase compared to the previous MY. Based on MY2024/25 export pattern, almost all of this volume will end up in the EU.

Post's MY2025/26 rapeseed oil export estimate is 445,000 MT, a twofold increase compared to the previous MY. Over 80 percent of MY2025/26 could go to the EU, as China, which was the second largest market in previous years, did not purchase any substantial volumes from September 2025-February 2026.

Figure 11: Share of Vegetable Oil Exports from Ukraine to the EU

Source: TDM

Ukraine is the net importer of palm oil and sources over 90 percent from Indonesia and Malaysia; the remaining volume is transshipped through the EU. Domestic demand for palm oil correlates with domestic oil prices, primarily sunflower oil, with domestic food producers shifting to whichever oil is more affordable. This allows them to avoid price hikes, especially for price-sensitive consumers. Currently sunflower oil prices are rising, prompting FAS/Kyiv to increase its MY2025/26 palm oil import estimate 4 percent over the previous year to 130,000 MT (Figure 12).

Figure 12: Domestic Price Dynamics for Sunflower Oil

Source: Information Agency APK Inform

Post estimates sunflower and palm oil food consumption based on the number of refugees who have left Ukraine, per the [United Nations High Commissioner for Refugees](#). Post's MY2026/27 forecast for sunflower oil food consumption decreased compared to its MY2025/26 estimate on the continued small but steady outflow of Ukrainian refugees. Post forecasts MY2026/27 palm oil consumption to decrease compared to MY2025/26, as higher MY2026/27 sunflower oil production drives down domestic prices, encouraging substitution.

Domestic food consumption for palm oil closely correlates with its imports.

FAS/Kyiv's MY2026/27 export forecast is:

- Sunflower oil – 5 MMT, an 11 percent increase against Post's MY2025/26 estimate
- Soybean oil – 550,000 MT, a 4 percent decrease
- Rapeseed oil – 825,000 MT, an 84 percent increase

Post forecasts MY2026/27 palm oil imports at 120,000 MT, an 8 percent decrease against MY2025/26 on reduced consumption.

Post's MY2025/26 import and domestic consumption estimates for palm oil are 18 and 13 percent higher, respectively, than the USDA official number on sunflower oil prices trending up.

Meals

Sunflower Meal

Soybean Meal

Rapeseed Meal

Production

Vegetable meals are byproducts of oilseed crush; therefore, their production and export dynamics mirror those of vegetable oils.

FAS/Kyiv's MY2026/27 production forecast is:

- Sunflower meal – 5.2 MMT, a 15 percent increase against Post's MY2025/26 estimate
- Soybean meal – 2.4 MMT, a 3 percent decrease
- Rapeseed meal – 1.1 MMT, an 82 percent increase

There is a growing price spread between soybean and sunflower meals at the time of report writing (Figure 13). The increase in domestic soybean meal prices stems from increased demand due to the growth of exports in the beginning of MY2025/26 (September 2025- February 2026) to a number of destinations, including the EU, Türkiye, Georgia, Egypt, and Tunisia.

Figure 13: Domestic Sunflower and Soybean Meal Prices in Ukraine, UAH/MT (EXW)

Source: Information Agency APK Inform

FAS/Kyiv considers MY2020/21 as the reference pre-war year for estimating consumption for subsequent MYs. Decreasing consumption in subsequent MYs reflects decreasing animal numbers. Note that Post keeps ending stocks for all vegetable meals at minimum levels, as they have a fairly short shelf life. Post assumes the volumes that have not been exported or put into feed consumption will eventually be destroyed due to loss of quality. Sunflower meal is the primary ingredient in feeding diets due to its abundance and lower prices compared to soybean meal (Table 1).

Table 1: Total Meal Consumption in Ukraine (SME Equivalent), 1000 MT

	MY2024/25	MY2025/26	MY2026/27
Sunflower Meal	1467	1201	1501
Soybean Meal	800	850	550
Rapeseed Meal	50	100	100
Total	2317	2151	2151

Trade

The EU is gradually losing its status as the primary market for vegetable meals (Figure 14).

Figure 14: Share of Exports for Vegetable Meals from Ukraine to the EU

Source: TDM

At the beginning of MY2025/26 for soybeans and sunflower (September 2025- February 2026) and rapeseed (July 2025- February 2026), the major markets included:

- Sunflower meal: China (66 percent of total exports) and EU (21 percent)
- Soybean meal: EU (75 percent) and Türkiye (9 percent)

- Rapeseed meal: China (49 percent), EU (20 percent), Türkiye (15 percent), and Israel (12 percent)

FAS/Kyiv's MY2026/27 export forecast is:

- Sunflower meal – 3 MMT, a 7 percent increase against Post's MY2025/26 estimate
- Soybean meal – 1.9 MMT, similar to MY2025/26
- Rapeseed meal – 1 MMT, a twofold increase
