

Voluntary Report – Voluntary - Public Distribution

Date: May 21, 2026

Report Number: ID2026-0022

Report Name: Indonesia Adds Import Licensing Requirements for Feed Ingredients of Plant Origin

Country: Indonesia

Post: Jakarta

Report Category: Agricultural Situation, Grain and Feed, Oilseeds and Products, Trade Policy Monitoring

Prepared By: Sugiarti Meylinah and Arif Rahmanulloh

Approved By: Lisa Ahramjian

Report Highlights:

Effective May 8, 2026, the Ministry of Agriculture changed its import licensing scheme for 57 plant-based feed ingredients, including soybean meal and corn-derivative products via Ministry of Agriculture Regulation 11/2026. This regulation establishes two separate pathways for the Ministry's import licensing-related approvals: one for soybean meal and wheat for feed and the other for 55 other feed ingredients. These changes threaten U.S. agricultural exports by using import licensing to enforce strict import timelines, control import volumes, designate import channels, and prohibit corn and broken rice imports for feed. The regulation aligns with Ministry of Trade Regulation 11/2026, which requires the Ministry of Trade to also issue import licenses for six commodities, including soybean meal and wheat for feed.

Overview: Import Licensing for Plant Products

Indonesia's import licensing regime for plant products varies by commodity, generally falling into one of four main categories:

1. Require approval from the Ministry of Agriculture (MOA) only
Example products: barley, corn gluten meal, alfalfa hay
2. Require approval from MOA and the Ministry of Trade (MOT)
Example products: soybean meal, feed wheat
3. Require approval from the MOT only
Example products: fresh fruit (e.g., apples, pears, grapes, citrus), broken rice for feed
4. Are under Commodity Balance, an inter-ministerial process which determines the total allowed import volume.
Example products: corn, rice, sugar, garlic

This report clarifies updates for categories 1 and 2 outlined above.

Recent Policy Changes

As previously reported via [ID2026-0016](#), MOT must now issue import licenses before soybean meal, feed wheat, and four other commodities can be imported under MOT Regulation 11/2026. To align with MOT's regulation, MOA issued MOA Regulation 11/2026 in May 2026, which became effective on May 8, 2026 (prior to its publication). This regulation outlines MOA's updated import licensing approach for 57 feed ingredients, including soybean meal and feed wheat. Each of these commodities has long had import licensing requirements, but this regulation introduces multiple changes. MOA 11/2026 revokes MOA 57/2015 and supersedes the plant-based feed ingredient provisions within MOA 15/2021. Neither MOA Regulation 11/2026 nor MOT Regulation 11/2026 have been notified to the World Trade Organization.

Key Provisions of MOA 11/2026

MOA 11/2026 establishes two distinct import licensing pathways for plant-based feed ingredients entering Indonesia. Under the regulation, fifty-five products are subject to a direct Import Permit requirement issued by the MOA. Meanwhile, two products are subject to the Recommendation Letter for Needs Planning (SPP-RK), which serves as a prerequisite document for obtaining Import Approval from the Ministry of Trade. The two pathways differ substantially in the following categories, as outlined in Table 1:

Approval documentation by commodity: For 55 plant-based feed ingredients, MOA must issue an Import Permit Letter. For soybean meal and feed wheat, MOA must issue a SPP-RK and then MOT must issue an Import Approval. By not listing corn for feed or broken rice for feed in the regulation, MOA is formally prohibiting imports of these products for feed purposes.

Volume and other controls: For soybean meal and wheat for feed, an inter-ministerial process establishes the volume which can be imported and specifies the authorized import channel. This process does not have a set schedule and approved import volumes are generally established on an ad hoc basis.

Soybean meal: FAS Jakarta previously reported how these controls were impacting 2026 soybean meal imports (see [ID2026-0016](#)). The below-described breakdown is not documented in any regulations, but reflects updated market intelligence:

Indonesia's soybean meal demand is estimated at 6 million metric ton (MMT), with the allowed import channel differing based on the end user:

- 5 MMT required by feed mills:
 - 3 MMT are MOA-designated to be imported by Berdikari, a state-owned enterprise (60 percent of the demand)
 - 2 MMT were already imported by commercial traders before MOA's policy was implemented (40 percent of the demand)
- 1 MMT required by feed self-mixers:
 - Traders are free to import but must demonstrate proof that the soybean meal will not be utilized by feed mills.

Wheat for feed: In recent years, all wheat imports for feed must be imported by Berdikari.

Table 1. Commodity Coverage

	Import Permit	SPP-RK
Approval Documentation	An entry permit letter (a letter of pre-import approval issued by the MOA)	A technical recommendation letter issued by MOA; MOT must then issue an Import Approval before imports can proceed
Commodities	55 plant-based feed ingredients: Cassava chips, barley, oats, sorghum, millet, soybeans (for feed only), canola seed, sunflower / sesame / safflower seeds, DDGS, corn gluten meal / feed, wheat bran / pollard, soybean hulls, copra meal, cassava residue, lucerne/alfalfa hay, molasses, soy lecithin, cotton seed meal, linseed meal, and others.	2 plant-based feed ingredients: Soybean meal, feed wheat

Volume and other controls	No cross-ministerial quota cap; realization tolerance of $\pm 5\%$ of approved volume	Volume and allocation determined through inter-ministerial coordination meetings
----------------------------------	---	--

Documentary requirements: While MOA 11/2026 forces no new documentary requirements, import permit applications require all previously-required documentation at the time of application. In contrast, the SPP-RK requires more limited documentation up front, with the remainder required much later in the process (i.e., to submit import realization).

For import permit applications, importers must submit the following:

- Certificate of the Country of Origin (stamped by the U.S. Chamber of Commerce)
- Certificate of Analysis or certificate of quality and safety based on Indonesian National Standards (SNI) issued by a U.S. laboratory. If the SNI does not exist, the U.S. laboratory must test for the following parameters set by the Minister of Agriculture:
 - moisture content
 - ash content
 - crude protein
 - crude fat
 - crude fiber
- Invoice, packing list, and certificate of weight.

For SPP-RK applications, importers must submit:

- Proposed import volume
- Certificate of the Country of Origin (stamped by the U.S. Chamber of Commerce)

Note: the other documents listed above for import permits are still required for SPP-RK, but after the SPP-RK has been issued.

For both import permit and SPP-RK applications, importers must provide the following:

- Business Identification Number (NIB)
- Company profile
- Application letter
- Statement that the imports will be used for feed only
- Statement on their warehouse capacity, distribution plan, and that all submitted information is true.

Approval flow: The process and timeline for each step in the approval flow are outlined in Table 2 for both import permits and SPP-RKs.

Validity: Once granted, import permits are only valid for three months from the date of issuance, meaning the shipment must arrive within that three-month timeline. This will require close coordination between importers and exporters to not exceed this timeline. In addition, import permits are not transferrable to third parties. Conversely, once granted, an SPP-RK is valid for one calendar year, and importers can realize multiple shipments using different ports under the same SPP-RK if the approved import volume is not exceeded. Importers can also make amendments during the period of validity, e.g., changing the country of origin.

Table 2. Procedural Structure

Stage	Import Permit Letter	SPP-RK
Submission channel	Direct to MOA's electronic system, SIMREK PKH	Via SINAS NK system ¹ , forwarded to MOA system; but while SINAS NK is not yet operational, submit directly through MOA's system
Administrative verification (PPVTPP)	Max. 1 working day	Max. 1 working day
Technical review (Director General of Livestock & Animal Health)	Max. 5 working days	Max. 5 working days; must be consistent with inter-ministerial coordination meeting outcomes
Issuance & delivery	Max. 1 day after technical review completion	Immediately upon Director General issuance
Application revision	3 revision opportunities, each max. 3 days; if deadline exceeded, application is rejected and must be resubmitted as new application	Directly rejected if technical/administrative requirements are not met; no staged revision mechanism
Document validity	3 months from issuance date; non-transferable to third parties; no amendments are allowed, but importers may revise and resubmit the application	1 calendar year; multi-entry for country of origin & ports; amendments possible within validity period
