

Market Monitor

No.19 – June 2014

www.amis-outlook.org

*The **Market Monitor** is a product of the [Agricultural Market Information System \(AMIS\)](#). It covers the international markets for wheat, maize, rice and soybeans, giving a synopsis of major market developments and the policy and other market drivers behind them. The analysis is a collective assessment of the market situation and outlook by the ten international organizations that form the AMIS Secretariat. Ultimately, the report aims at improving market transparency and detecting emerging problems that might warrant the attention of policy makers.*

WORLD TRADE
ORGANIZATION

World Supply-Demand Outlook

Improved crop prospects along with diminishing concerns over shipments from the Black Sea region kept prices under pressure. World inventories of major cereals are foreseen to grow further in the new season. Large cereal supplies in exporting countries are expected to intensify competition for markets in the new season (2014/15). Initial forecasts for soybeans indicate an ample crop in 2014/15.

	From previous month f'cast	From previous season

Ending Stocks	187	187	191	187	177	180	182

- **Wheat** production forecast in 2014 up slightly from last month on improved prospects in the EU and Ukraine.
- Utilization in 2014/15 to grow by 1.6 percent, mostly on higher food but also feed uses.
- Trade in 2014/15 to fall below the 2013/14 record, mainly on expectations of smaller wheat purchases by China and Brazil.
- Stocks (ending in 2015) to increase more than anticipated earlier given the likelihood of a further buildup of inventories in China and India.

Ending Stocks	168	182	164	172	162	162	169

- **Maize** production forecast in 2014 revised, on improved prospects in the US and bigger than earlier expected crops in South America.
- Utilization to expand by 2.4 percent in 2014/15, primarily driven by growing feed demand in China and India.
- Trade in 2014/15 to contract by 5 million tonnes, reflecting smaller imports by the EU.
- Stocks (ending in 2015) forecast to increase with larger inventories in Argentina, Brazil, EU and US more than offsetting a decline in China.

Ending Stocks	111	110	110	110	181	180	182

- **Rice** production forecast for 2014 raised on improved prospects in China.
- Utilization set to expand by 2.4 percent in 2014/15, with much of the increase directed to food consumption.
- Trade in 2014 set to increase by 6 percent to a new record. Early prospects for 2015 (shown under 2014/15) points to little change.
- Stocks (ending in 2015) adjusted upwards, consistent with a more buoyant 2014 production outlook.

Ending Stocks	67	82	26	28	28	30	31

- **Soybeans** 2013/14 global production forecast raised slightly as higher estimates for South America offset downward corrections in India.
- Utilization forecast for 2013/14 raised, primarily on higher estimates for China, Paraguay and Uruguay; now pointing to an increase of 5.7 percent compared to last season.
- Trade forecast lifted further on higher exports by the US and Brazil; at the same time, US imports seen rising to a record level.
- Stock forecast (2013/14 carry-out) adjusted upward on higher estimates for Brazil, Argentina and the EU - offsetting a downward revision for the US.

All totals (world estimates and forecasts) shown are computed from unrounded data. All changes, in absolute or percentage terms, are also calculated based on unrounded figures and accordingly reported in the supply/demand commentaries. Analysis presented in this report is largely based on information as of late May 2014. **Explanatory notes** and list of **sources** are available at the end of the report.

Crop Monitor*

Crop Conditions in AMIS countries (as of May 28th)

Crop condition map synthesizing information for all four AMIS crops as of May 28th. Crop conditions over the main growing areas for wheat, maize, rice, and soybean are based on a combination of national and regional crop analyst inputs along with earth observation data. **Crops that are in less than favourable conditions are displayed on the map with their crop symbol.**

Highlights

Wheat- Overall conditions are still mostly favourable in the northern hemisphere. However, significant concern continues in the US southern plains due to dry conditions. In Canada the cool weather continued and is causing some delays for spring wheat. In Turkey there is concern due to hot dry weather. In the southern hemisphere planting is progressing and conditions are generally favourable at this early stage of the season, with some concern over dry conditions in parts of South Africa and Australia.

Maize- Overall conditions are favourable. In the southern hemisphere, the season is nearly complete. In Argentina, conditions are favourable though there is some concern over excess wetness, which is delaying harvest. In Brazil, an overall decrease in production is expected owing to reduced planted area and yield. In the northern hemisphere conditions are generally favourable and planting is nearly complete. There is minor concern over planting delays in the northern US Cornbelt.

Rice- Conditions are mixed. Production prospects are below average in Viet Nam and Thailand. In China, there is some concern over excessive wet conditions affecting the early-planted rice crop. In the EU and US planting is ongoing and conditions are favourable.

Soybeans- In the southern hemisphere the season has generally progressed well and overall prospects are still favourable. In Argentina, overall crop conditions are good, although there is some concern regarding excessive wetness in some areas. In Brazil, a bumper crop has been harvested due primarily to increased planted area and mostly favourable conditions. In the northern hemisphere, planting of the 2014/15 crop has started under generally favourable conditions.

El Niño situation update

As noted in the previous crop monitor issues, there are still prospects for development of El Niño conditions during the late summer or autumn of the northern hemisphere. May outlooks (from the International Research Institute for Climate and Society, the U.S. National Oceanic and Atmospheric Administration, and the Australian Bureau of Meteorology) continue to indicate this possibility, with the probability of occurrence around 70 percent. Though neutral conditions continue to prevail, ocean warming has been observed from March through May which characteristically precedes El Niño.

*Crop Monitor is developed for AMIS by GEOGLAM. It summarizes latest conditions for AMIS crops based on regional expertise and analysis of satellite data, ground observations, and meteorological data.

Wheat: In the northern hemisphere winter wheat conditions are still generally favourable. In **Russia**, winter wheat conditions are mostly good except in parts of the southern growing regions, where there is some concern over hot dry weather that developed towards the end of the month. Spring wheat planting is nearly complete and conditions are generally favourable at this early stage. In **Ukraine**, conditions are good and crop development is ahead of average. In the **EU** prospects are favourable, and similar to last year. In **Turkey** conditions are of concern due to prolonged above average temperatures and dry conditions, with the exception of western growing areas. Low levels of water reservoirs are also a concern for irrigated areas. In **Canada**, overall conditions for winter and spring wheat are still favourable, however below-normal temperatures across most of the growing regions continued, and delayed field operations and planting by up to one week are particularly affecting spring wheat in the eastern prairies. In the **US**, winter wheat conditions are still mixed. In the Southern Plains, the heart of the winter wheat region, drought has continued to hamper crop conditions and production is expected to be down notably in that area. Other winter wheat growing areas have closer to normal conditions, helping salvage the US production, which is still expected to be down from last year. The spring wheat development is proceeding normally. In **Mexico**, overall conditions are favourable. However, the lack of cool temperatures in parts of the growing regions may decrease production slightly. In **China**, conditions are generally favourable for winter wheat, which is in flowering to harvest stages. In **Brazil**, planting is progressing and will continue through mid-June in the major producing states. Conditions at this early stage of the season are good and area is expected to increase. In **South Africa**, planting is in progress in the winter rainfall region in the south-western part of the country. Following a wet summer, dry conditions have prevailed and are negatively impacting planting, however rainfall is expected in coming days. In **Australia**, planting is on-going and overall conditions are favourable, however there is concern over dry conditions in north-eastern growing regions, which has limited planting opportunities. In **Argentina**, planting has started, however has been hampered due to excess moisture.

Wheat Conditions for AMIS countries as of May 28th.

For detailed description of pie chart please see box on page 4.

Maize Conditions for AMIS countries as of May 28th.

For detailed description of pie chart please see box on page 4.

March winds. In the **US**, crop development is proceeding normally with no widespread concerns about the conditions. However, there is some concern over planting delays along the most northern cornbelt. In the **EU**, maize is in early development stages with overall normal conditions. In **China**, overall conditions are favourable and the crop is between planting (northern regions) and flowering (southern regions) stages. In **Russia**, planting is complete and moisture conditions are sufficient at this early stage. In **Ukraine**, crop moisture conditions are favourable for the emergence and establishment of the newly planted crop.

Maize: In the southern hemisphere conditions are variable. In **Argentina**, overall conditions are still favourable. However, there is some concern over excess wetness, which is delaying harvest. In **Brazil**, condition of the second maize crop, which is in the reproductive stage, is similar to that of last year. The first maize crop harvest is complete and production is reduced. Accounting for both the first and second crops, a decrease in production is expected owing to reduced planted area and yield. In the northern hemisphere conditions are favourable. In **Mexico**, conditions are mostly favourable across the country for both the winter and spring planted crops. There is still some concern over the winter crop, currently being harvested, due to the impact of the strong

Rice: Conditions are mixed. In **Indonesia**, conditions are favourable and rainfall has been ideal for supporting the crop through the reproductive phase. In **Viet Nam**, prospects for the fall-winter rice are below average. The crop is generally between flowering and harvesting stages. The main reason for the reduced production is delayed sowing, January floods and cooler than usual weather. In **Thailand**, overall prospects remain below average primarily due to the second rice crop that was planted before February. Lower prospects are due to the cold weather in December and January, dry conditions and pest and weed outbreaks in parts of the country. Conditions are favourable for the second rice crop, planted in February and March in the lower northern and central regions, which is in vegetative to flowering stages. In **China**, conditions in the early season rice region are unfavorable due to the excessive rainfall. Early season rice is within maturing stage and single cropped rice is in seedling stages. In **Brazil**, prospects are good. Harvest is complete, and production is higher relative to last year due to the increase in planted area and favourable weather. In the **EU**, sowing is nearly complete with favourable conditions in southern Europe (Spain, Italy, Greece, France). In the **US**, crop development is proceeding normally.

Rice Conditions for AMIS countries as of May 28th.

For detailed description of pie chart please see box below.

Soy Conditions for AMIS countries as of May 28th

For detailed description of pie chart please see box below.

Pie chart description: Each slice represents a country's share of total AMIS production (5-year average). Main producing countries (representing 90 percent of production) are shown individually, with the remaining 10 percent grouped into the "Other AMIS Countries" category. The area within each slice is divided between crops in-season (colour) and out-of-season (gray). The in-season portion is coloured according to the various crop conditions within that country. When conditions are labelled as 'poor' or 'watch', icons are added that provide information on the key climatic drivers affecting conditions. The coloured areas reflect conditions by area rather than overall national production.

Sources and Disclaimers: The Crop Monitor assessment is conducted by GEOGLAM with inputs from the following partners (in alphabetical order): Argentina (INTA), Asia Rice Countries (AFSIS, ASEAN+3 & Asia RICE), Australia (ABARES & CSIRO), Brazil (CONAB & INPE), Canada (AAFC), China (CAS), EU (EC JRC MARS), India (ISRO), Indonesia (LAPAN & MOA), International (CIMMYT, FAO, IFPRI & IRRI), Japan (JAXA), Mexico (SIAP), Russia (IKI), South Africa (ARC & GeoTerraImage & SANSA), Thailand (GISTDA & OAE), Ukraine (NASU-NSAU & UHMC), USA (NASA, UMD, USGS – FEWS NET, USDA (FAS, NASS)), Vietnam (VAST & VIMHE-MARD). The findings and conclusions in this joint multi-agency report are consensual statements from the GEOGLAM experts, and do not necessarily reflect those of the individual agencies represented by these experts. Map data sources: Major crop type areas based on the IFPRI/IIASA SPAM 2005 beta release (2013), USDA/NASS 2013 CDL, 2013 AAFC Annual Crop Inventory Map, GLAM/UMD, GLAD/UMD, Australian Land Use and Management Classification (Version 7), SIAP, ARC, and JRC. Crop calendars based on GEOGLAM partner crop calendars and USDA crop calendars.

More detailed information on the GEOGLAM crop assessments is available www.geoglam-crop-monitor.org.

International Prices

International Grains Council (IGC) Grains and Oilseeds Index (GOI) and GOI sub-Indices

	May 2014 Average*	% Change	
		M/M	Y/Y
GOI	266	- 0.1%	- 5.8%
Wheat	246	+ 0.2%	- 4.7%
Maize	244	- 0.8%	- 15.8%
Rice	176	- 0.2%	- 12.0%
Soybeans	278	+ 0.1%	-0.5%

*Jan 2000=100, derived from daily export quotations

Wheat: The IGC GOI wheat sub-Index was virtually unchanged m/m. Poor hard red winter (HRW) crop conditions and slow spring planting contributed to a rally in US futures and export prices in early May. However, with overall global supply expected to be adequate, prices eased in the second half of the month, particularly as rains improved prospects in some areas. Concerns about the impact of political tensions eased in the Black Sea region, but there were some worries about overly hot and dry weather in parts of Russia and Ukraine.

Maize: World maize prices moved lower in May, pressured by generally favourable northern hemisphere crop prospects and expectations for ample exportable supplies. With declines in the US, South America and the Black Sea region, the IGC GOI maize sub-Index was down by 1 percent m/m, and is 16 percent lower y/y.

Rice: Asian rice markets showed mixed trends in the past month. Modest declines in Thailand, due to continued releases from government intervention stocks, contrasted with generally higher prices elsewhere in the region. The IGC GOI rice sub-Index was slightly lower m/m.

Soybeans: The IGC GOI soyabean sub-Index was broadly steady m/m, although physical markets at the major origins were mixed. Modest gains in Argentina, mainly underpinned by harvest delays, contrasted with steady to marginally lower prices in the US and Brazil. China's import demand has remained strong and, with tight old crop availabilities, prices are roughly on a par with year ago levels.

Policy Developments

- Developments on domestic policies: **China's** waiver on VAT for state-owned grain marketing enterprises is expanded as from early May 2014 to include soybeans held in government reserves, while imported soybeans remain subject to a 13 percent VAT. Auctions to sell japonica and indica rice and maize from state reserves were announced. The conditions of market intervention through stockpiling of wheat and early season rice were announced, the minimum prices are raised by 5 percent for wheat to CNY2,360/tonne (USD382), and by 2 percent for rice to CNY2,700/tonne (USD438). In **Argentina's** province of Cordoba, a subsidized credit line of 20 million pesos (USD 2.5 million) was opened to promote wheat production during the current agricultural year. In **Brazil**, government financing of agricultural loans was increased by 15 percent compared to the previous year. In an attempt to expand domestic rice production, the government of **Nigeria** has earmarked 48,000 hectares of farmland for rice cultivation. The domestic procurement price for wheat was raised in **Egypt** by 16 percent to EGP500/ardeb (approx. 150kg) (USD 466/tonne). **Viet Nam** announced that it is considering the removal of minimum export prices for rice.
- A number of trade measures were announced this month. The Trade Ministry of **Indonesia** announced that, as from 4 May 2014, the emergency import tariff of 20 percent applied on wheat flour was to be lowered to 5 percent and to be complemented by an import quota of 444,141 tonnes. The quota is to be allocated to such countries as Turkey, Sri Lanka and Ukraine and to be applied until December 2014. As notified to the WTO, **Japan** is seeking comments on a trade facilitating proposal to review the maximum residue limits (MRLs) of certain agricultural chemicals at higher levels for barley, wheat, sorghum and soybeans. The national standards and specifications for foods and food additives will also be revised.
- Biofuels: Export taxes on biodiesel were reduced in **Argentina** from 21 percent to 11 percent, and a Bill proposed to Congress to temporarily eliminate biofuel production taxes. This follows the implementation of EU anti-dumping measures on biodiesel imports from Argentina. **Brazil** will increase its biodiesel mandate from 5 percent to 6 percent in July and to 7 percent in November.

Soybeans	546	-0.2%	+0.7%

Source: CME

Historical Volatility – 30 Days

	Monthly Averages		
	May 2014	April 2014	May 2013
Wheat (Nearby)	25.7%	32.4%	27.9%
Maize (May)	20.4%	20.6%	29.7%
Rice (Nearby)	10.1%	13.8%	16.2%
Soybeans(Nearby)	21.0%	18.9%	24.7%

Futures Prices

Prices for maize declined steadily for most of May as favorable sowing conditions in the US prevailed and the USDA reported rapid planting progress. After reaching a 10 month high early in May, wheat prices also declined as prospects increased for ample harvests elsewhere and rains broke drought conditions in US Southern Plains preventing further deterioration of crop conditions. Normal export shipments and reduced tensions in Black Sea region also led to the softening of wheat prices. Futures soybean prices were mostly unchanged, but declined at month end due to favorable US growing conditions, abundant supplies in South America and demand uncertainty arising from China. Additionally, US imports of Brazilian beans - estimated to total 2 million tonnes – are helping to alleviate the tight US soybean balance sheet. Rice prices similarly exhibited a declining price pattern during May.

Volumes and Volatility

Volumes for wheat, maize and soybeans declined m/m between 22 and 35 percent and except for wheat, were lower y/y . Implied volatility, which had spiked briefly during late March, exhibited relatively normal levels.

Forward curves

Forward curves showed little fundamental change in their configurations. Strong export demand for maize is causing old crop (July) to trade at a premium to new crop (December). Soybeans persist in strong backwardation and wheat showed a slight steepening of the curve as nearby prices declined relative to deferred prices.

Investment flows

The trading flows of managed money tended to mirror the price patterns of wheat, maize and soybeans. The reduction of net long positions following the first week of May for wheat and maize coincided with their price declines. This reduction was most pronounced in maize which showed sales of 86 thousand contracts, equivalent to 11 million tonnes. Similarly, soybean selling by managed money during the third week of May accompanied the decline in soybean prices. Swaps dealers activities were unremarkable.

AMIS Market Indicators

Some of the indicators covered in this report are updated regularly on the AMIS website. These, as well as other market indicators, can be found at:

<http://www.amis-outlook.org/amis-monitoring/indicators/>

Explanatory Notes and Calendar

The notions of **tightening** and **easing** used in the summary table of “**World Supply and Demand**” reflect judgmental views which take into account market fundamentals, inter-alia price developments and short-term trends in demand and supply, especially changes in stocks.

All totals (aggregates) are computed from unrounded data. World supply and demand estimates/forecasts in this report are based on the latest data published by USDA, IGC and FAO. They may vary for many reasons, but mainly because of different methodologies and release dates.

FAO-AMIS: World estimates and forecasts are based on information received from AMIS countries as well as FAO data.

Dates: Refer to the release date of the data from the selected sources: FAO, IGC, and USDA.

Production: Cereal production data refer to the calendar year of the first year shown. Rice production is expressed in milled terms. Soybeans production data refer to the split (i.e. 2013/14) season.

Supply: Defined as production plus opening stocks.

Utilization: For wheat, maize and rice utilization includes food, feed and other uses (“other uses” comprise seeds, industrial utilization and post-harvest losses). For soybeans, it comprises crush, food and other uses.

Trade: Data refer to exports. For wheat and maize, trade is reported on a July/June marketing year basis, except for the USDA maize trade estimates, which are reported on an October/September basis. For rice, trade covers flows from January to December of the second year shown and for soybeans from October to September. Trade between European Union member states is excluded.

Ending Stocks: Data is calculated as the aggregate of carry-overs at the close of national crop seasons ending in the year shown.

AMIS Crop Calendar

* The percentages refer to the global share of production (average 2008-12).
